Cette revue est disponible en édition française. Revue Statistique du Canada nº 11-003F au catalogue.

Series published in this Review are available from CANSIM, the computerized time series data bank of Statistics Canada, on printouts or in machine-readable form for use on computers. Identification numbers given as a reference at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada. It should be noted that all time series in CANSIM are regularly updated as new or revised data are released. Annual figures are also available from CANSIM, more information can be found in the *CANSIM Summary Reference Index* and the *CANSIM Series Directory*. Both the documents are available directly from CANSIM staff.

Seasonal Adjustment

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant.

Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation caused by the difference in the number of working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series still contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

SYMBOLS

The following standard symbols are used in this and other Statistics Canada publications:

. . figures not available.
. . . figures not appropriate or not applicable.
- - amount too small to be expressed.
— nil or zero.
† advance estimates.
c correction
p preliminary figures.
r revised figures.
x confidential to meet secrecy requirements of the Statistics Act.
MCD months for cyclical dominance (see above).

Statistics Canada should be credited when republishing all or any part of this document.

CANADIAN LOW INCOME STATISTICS

G. Oja and R. Love*

Introduction

The first Canadian data describing the extent of low income in Canada came from an analysis of 1961 Census data.[1] The income levels determined to delineate low income families from the rest of the population were differentiated by family size and were set as follows (the updated cut-offs for 1974 are presented as well).

Family size[1]	Low income cut-off	
	1961	1974
	dollars	
1	1,500	2,518
2	2,500	4,196
3	3,000	5,034
4	3,500	5,872
5 or more	4,000	6,713

[1] Family is defined as a group of individuals sharing a common dwelling unit and related by blood, marriage or adoption.

These cut-offs were not determined by any complex analytical technique but were a well-informed choice based on some knowledge of expenditure patterns. At that time it was unnecessary to have the lines pinpointed more precisely since the major purposes were to describe and demonstrate the existence of the low income population. Most everybody would have agreed that these cut-offs were "low" and if Canada had a significant proportion of the population with income levels less than these cut-offs, then "poverty" was a problem.

The low income cut-offs were revised recently when the results of the Family Expenditure Survey (FAMEX) for 1969 became available. The revision considered not only income and family size, as before, but also the urbanization category. FAMEX surveys collect information on expenditure patterns of Canadian families along with information on family characteristics and income; unfortunately, however, national surveys are taken only intermittently (at best every 10 years).[2] Between surveys, therefore, the cut-offs are being updated on the basis of changes in the Consumer Price Index (CPI). The 1969 cut-offs and 1974 updates are presented in Table 1 following.

The annual Survey of Consumer Finances (roughly biennial from 1961 to 1971) provides the necessary data for an examination of the characteristics of the poor and non-poor populations as defined by the cut-offs.

Revision of the Low Income Cut-offs

No reformulation of low income concepts was considered in the revision of low income cut-offs to reflect information obtained in the 1969 FAMEX survey. It was purely a statistical revision with, however, an examination through regression analysis of two geographic variables, the region of residence and the urbanization category.

---

* Mrs. Oja is Director and Mr. Love an Economist on the staff of the Consumer Income and Expenditure Division. This article is based on a paper presented at the Conference on Income and Wealth, Helsinki, Finland, August 1975. Copies are available on request to the authors.

[1] The poverty lines used by Jenny Podoluk in her 1961 Census monograph are the same lines as the ones on which the analysis in Chapter 6 of the *Fifth Annual Review* of the Economic Council of Canada was based. These lines were then used by Statistics Canada (appropriately updated) to publish data for the years 1967 to 1972 (prior to the revision). Another set of lines, considerably higher, was proposed by the Special Senate Committee on Poverty. The committee also proposed a different updating method (using the growth in personal income per "capita") than that used by Statistics Canada. Although, these poverty lines are occasionally referred to, no statistics on that basis have been produced since 1969.

[2] Small scale family expenditure surveys covering eight to 14 cities are taken more frequently, usually biennially.

TABLE 1 Low Income Cut-offs by Family Size and Urbanization Category 1969 and 1974

Family size	Urbanization category				
	500,000 or more	100,000 - 499,999	30,000 - 99,999	Small urban	Rural (farm and non-farm)
	1969[1]				
1	2,599	2,434	2,363	2,174	1,890
2	3,769	3,529	3,426	3,152	2,741
3	4,809	4,503	4,372	4,022	3,498
4	5,719	5,355	5,199	4,783	4,159
5	6,393	5,986	5,812	5,347	4,650
6	7,018	6,571	6,380	5,870	5,104
7 or more	7,695	7,205	6,995	6,435	5,596
	1974[2]				
1	3,456	3,235	3,142	2,890	2,512
2	5,008	4,690	4,554	4,189	3,644
3	6,391	5,986	5,810	5,347	4,648
4	7,601	7,117	6,909	6,357	5,527
5	8,496	7,955	7,724	7,108	6,181
6	9,328	8,734	8,480	7,801	6,783
7 or more	10,228	9,574	9,297	8,552	7,437

[1] Derived from regression analyses of 1969 FAMEX data

[2] Updated from the 1969 lines by the use of the Consumer Price Index

(CPI 1969 = 125.8 ; CPI 1974 = 166.8).

The basis of cut-off determination is the size of the ratio of expenditures on food, shelter and clothing (FSC) to total income. The pre-1969 criterion was 70 per cent,[3] or 20 per cent above the overall FSC expenditure-income ratio of 50 per cent as established in 1959. The revised criterion of 62 per cent, for 1969, reflects a change from 50 to 42 per cent in the overall FSC expenditure-income ratio based on the FAMEX 1969 survey.[4]

Study of the effect of the two geographic variables indicated that, besides family size and income, the most important variable explaining variations in expenditure on FSC was the urbanization category. For lack of special price and quantity data needed to develop criteria for individual areas, the 62 per cent FSC expenditure-income criterion was used for all low income cut-offs

Nature and Uses of the Low-income Cut-offs

The low income cut-offs, sometimes referred to as poverty lines, can be considered as one set of roughly equivalent incomes for families of different sizes at the low end of the income spectrum. They are not necessarily points of minimum subsistence levels of income in general and even less so in specific circumstances, such as for a family of four consisting of a mother and three children in rental housing in, say, Montreal or Toronto.

The lines have no official status; they lack specificity and are not designed to serve as adequacy criteria or support levels. In the absence of more suitable normative measures it is difficult to oppose such uses. However, low income statistics are social data which serve their proper purpose when used as a general monitoring device and a tool for setting some of the broad parameters for policy planning and evaluation.

Some Problems Interpreting the Data

The first of these problems relates to the inadequacy of a one year time frame for measuring income. One year's income may not represent a true picture of economic status; for example, a farmer with a poor crop this year or facing unfavourable market conditions or a university student with a low income now but with higher income expectations is considered poor. More generally, in any year there will be those whose incomes are exceptionally high (non-poor) or low (poor).

---

[3] If a family spends 70 per cent of its income on food, shelter and clothing, it has only 30 per cent at its disposal for taxes and all other remaining expenditure items. This cut-off was arbitrarily chosen and based on an assumption that such families would be in straighted circumstances

[4] The American approach is different: it is based on estimating a minimum food budget on a normative basis and by making additional assumptions to arrive at the resulting low income cut-offs.

An unpublished paper giving further information on the revision is available on request to the authors.

Analysis of the characteristics of families who move in and out of low income status in 1968 and 1969 requires some simplifying assumptions about the data, for example, the assumption that the families as structured in the spring of 1970 and for whom income was reported remained the same during 1968 and 1969. Obviously this is not true – some family units in 1968 would have been smaller (births), others would have been larger (deaths), some family units would have existed in 1968 but not in 1969 (deaths, family break up, emigration and immigration) and vice versa. For these and other reasons conclusions as to the extent of persistence of low income must be viewed as tentative.[5]

A second problem relates to the extent to which an income-based poverty criterion is an adequate discriminator between the "poor" and the "non-poor". Of most relevance is the omission of the consideration of wealth (or perhaps the unawareness of the implicit assumption made about wealth in the present statistics) in determining one's overall economic position.

In accounting for wealth there are problems both of a conceptual and practical nature.[6] For the current analysis available asset-debt information is used as qualifying data and not incorporated into the classification for two main reasons: first new lines would have to be developed, and secondly asset-debt information is not available on an annual basis and low-income statistics are published annually.

The following tables examine the low-income and non-low-income populations (the "poor" and "non-poor") in the context of selected non-financial and financial characteristics: age, sex, education and work experience of the unattached individual or family head; assets, debts, average family income and size, and major assets (home ownership and automobiles). The period covered is 1968 and 1969. The characteristics are measured as of Spring 1970, the date of the Survey of Consumer Finances, except for experience which is based on 1969 work patterns. Characteristics in the previous year may or may not have been different; age changes in a predictable way but no allowance has made here for this; sex would not change; educational attainment for adults is a fairly stable characteristic.

Income Status Over Two Years

Two groups in the population are identified in tables:

1. Persistent group – Those units with low-income status in **both** 1968 **and** 1969.

2. Reference group – Those units with low-income status in **either** 1968 **or** 1969.

A **Persistence Ratio** is calculated as the ratio of units in the persistent group to units in the reference group. For study of movements into and out of the low-income status, the population is divided into **Movers** and **Non-movers** according to low-income status in 1968 and 1969, as follows:

Movements into and out of low income status	Low-income status in	
	1968	1969
Out-movers	IN	OUT
In-movers.	OUT	IN
Non-movers	IN	IN
Non-movers	OUT	OUT

Table 2 gives the percentage distribution over four non-financial characteristics of unattached individuals and families over the two-year period for both years (persistent group), for 1968 and 1969 separate, and for either year (reference group). Statistics are presented separately for unattached individuals and families. The table suggests the following comments:

1. **By sex of head** – Unattached females and female headed families constitute a larger proportion of the reference and persistent populations than the total populations. Of all families 7.5 per cent have female heads whereas 15.9 and 20.0 per cent of the reference population and persistent population respectively, are headed by females. Female-head family units constitute a larger proportion of the persistent population than of the reference population.

2. **By age of head** – Older (head 65 and over), and to some extent younger families (head less than 25), represent a larger proportion of the reference group than of the total population. However, the younger population constitutes a smaller proportion of the persistent group than the reference group.

3. **By education of head** – The reference group has less formal education than the entire population; 32 per cent of the reference group has heads with some elementary education only, whereas only 17.7 per cent of all family heads have this level of education. At the degree level, 7.9 per cent of all family heads have a degree. The persistent group has even lower levels of education than the reference group; 38.6 and 1.3 per

(Continued on page 120)

---

[5] Income data for 1968 were collected on the same survey that obtained detailed information on 1969 incomes. A close examination of available information indicates a possible understatement of 1968 income which may be expected because of the longer recall period for the 1968 income and because the 1968 income question did not obtain detailed income components.

[6] One suggested approach is to annuitize wealth into income (for a discussion of this approach see Weisbrod and Hansen, *American Economic Review*, December 1969).

OBSERVATIONS

Current Program of Income Statistics

The statistics on the distribution of money income are now probably the most widely used indicators of the socio-economic well-being of the population. Prior to 1972, the data were collected at two-year intervals while, beginning in 1972, the surveys were placed upon an annual basis. The program which has been developed attempts to meet a variety of objectives. Because the data are an essential input into the simulation of policy alternatives and, in fact, in recent years have been the basis for costing social security programs, the data must be high quality. Because Canada is a federal state, sample sizes must be large enough to provide principal statistics for the various provinces. Finally, because there are considerable demands for other data to be collected in conjunction with income, the survey program has to be flexible enough to accommodate new data.

Survey Program

To meet these objectives, the approach which has been adopted for the collection of income data is a varying two-year cycle. In one year, income data are collected in conjunction with the April Labour Force Survey, while in the second year a separate survey is conducted independent of the labour force survey but using the sampling frame. The monthly labour force survey interviews approximately 35,000 households and uses a stratified multi-stage sample. Attaching an income questionnaire to the survey makes it possible to collect income data from a large sample at a moderate incremental cost. The labour force survey itself collects data on household composition, age, occupation, etc. In the month in which income data are collected, some supplementary questions are added on aspects such as weeks worked during the previous year and education. Income data are collected from each household occupant aged 14 and over by means of a separate questionnaire which is left for self-enumeration. Methodological studies in Canada and the United States have shown that self-enumeration provides the most accurate income data. The majority of income recipients in Canada file income tax returns and have financial records and the survey is scheduled for the time when income tax returns are being prepared. The evidence is that tax returns are consulted in answering the survey questionnaires. Further, the survey currently asks 17 questions on sources of income as a further aid to recall as well as a question on the amount of income tax paid. An evaluation of the survey data shows that the survey measures the distribution of wages and salaries very accurately. It also measures very well the distribution of various types of social security payments which are universal in scope such as family allowances and old age pensions. The experience with the measurement of income from self-employment is somewhat more erratic as the coverage varies from survey to survey. The weakest coverage is of investment income, of which only two-thirds or so appears to be reported, and of some types of transfer payments such as welfare payments. However, because the dominant sources of income are reported best, our experience is that normally approximately 95 per cent of the aggregate money income received by households is reported on the surveys. Of the remaining 5 per cent, not all of the discrepancy is accounted for by underreporting. The survey excludes institutions, persons who have died or left the country and certain northern areas. Generally, the surveys provide an accurate picture of the distribution of and movement in the income distribution. Income data have also been collected from a 20 per cent of households in the 1961 Census and a 33 1/3 per cent sample of households in the 1971 Census. Comparisons of the income data collected on the surveys have shown that, despite much smaller sample sizes, the survey data are of adequate reliability for most purposes.

Attaching the income survey to the labour force survey meets one of the main objectives, that of providing basic data on the income distribution regionally. Regional income disparities are of considerable policy concern while changes in social security programs must be negotiated with the provinces so that the regional impact of changes is constantly a policy issue. Representations have been received to enlarge the sample size even further to permit more regional disaggregation. Attempts are being made to expand the sample size of the labour force survey to 60,000 households on a regular basis. If this occurs, funds will be requested to enlarge the income surveys to the same size at two-year intervals.

Separating the income surveys from the labour force surveys in alternate years meets one of the other objectives of the program, that of flexibility as to the contents of the survey. Surveys attached to the labour force survey now have a standard set of questions which are only modified if there are changes in social security programs or other changes which affect sources of income or taxes. Surveys which are independent of the labour force survey are vehicles for the collection of special data centered on the income distribution. In 1970, data were collected on the components and amounts of asset holdings and indebtedness, while in 1973 the survey focussed on long-term work history and unemployment experiences. To an increasing extent, remuneration takes the form of fringe benefits rather than cash remuneration. The 1975 survey will probe into benefits in kind as well as the utilization of the health and educational systems. The 1977 survey will again collect data on asset holdings and indebtedness.

The separate income surveys are invariably more expensive because they lose the economies which are associated with attaching the surveys to the labour force survey. As a result, the sample sizes are much smaller, ranging from 12,000 to 15,000 households. Further, because the questionnaires are longer and more complex, data are sometimes collected through direct interviews rather than self-enumeration. However, enumerators are carefully trained and instructed to interview those family members best equipped to answer the questions. Our experience has been that these changes in methodology do not affect the consistency of the data so that year movements appear reasonable over time.

Over the last few years, the survey program has produced data from a large sample in respect to the year 1973 and from a smaller sample in respect to 1974. The 1973 data are available in publications: Catalogue 13-207 – *Income Distributions by Size in Canada, 1973.* Catalogue 13-208 – *Family Incomes, Census Families 1973.*

A report based on the concept of "income after tax" containing data for 1972 and 1973 will be released later in 1976. Edited micro data files for 1973 are available; users interested in doing their own computer work should contact Mrs. Allison Paoliello, Room 1122, General Purpose Building, Telephone: 992-4742.

The 1974 data are only available in preliminary form at the moment in the report Catalogue 13-206, *Income Distributions by Size in Canada, Preliminary Estimates 1974.* Publications 13-207 and 13-208 for 1974 will become available in a few months.

Measuring the Impact of Inflation on Low Income Groups

The question of the incidence of inflation on different population groups, and its effect on the distribution of incomes and consumption, has attracted much public attention in Canada and elsewhere in recent years. There is also a great deal of public debate on the appropriateness of indexing welfare benefits and pensions to the official Consumer Price Index for Canada. One of the most obvious approaches to answering these questions is to construct Consumer Price Indexes for a variety of socio-economic groups within the population.

Over the past year, using available data, experimental work to measure the impact of price change on low income families has been carried out in Canada. Tests have been made for two low income groups, viz., pensioner families whose major source of income is transfer payments, and low income families with children. In these calculations, the consumption patterns used as weights were based on 1969 family expenditure survey data, and the price information was supplied by the regular Consumer Price Index. Shelter has been excluded in these two special price index calculations (and from the control index), for two reasons: first, the development of reliable home ownership and rent indexes for special population groups is difficult; and second, government programs designed to subsidize housing for low-income families are growing in Canada.

The standard argument is that households other than the target households have different consumption patterns, and that, *ipso facto,* prices have a different impact on their cost of living. The available empirical evidence, albeit tentative, does not appear to support this argument. The work on special low-income CPIs indicates that re-weighting, i.e., combining different consumption patterns with existing price indexes – does not significantly and consistently favour any particular income group. Similarly, the Economic Council of Canada, in its latest annual review, demonstrated that CPIs that are calculated on the basis of different consumption patterns of a large range of income groups with higher as well as lower incomes than the target group do not significantly differ from each other. Results like this are also obtained by re-weighting the CPIs for several other countries. The common features in these calculations are that, over the past few years, the proportion of food in the consumption baskets fell with the rise in family income; and that the change in food prices affected the different recalculated CPIs, but only marginally. Obviously, price trends for the various items in the consumption basket tend to offset each other's

(Continued on page 128)

[1] The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2] Includes logging, fishing, trapping and hunting. [3] Includes mechanical and construction. [4] Includes a small number in non-specified occupations. [5] Does not include students entering Canada on students' visas. [6] Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. **Source: Quarterly Bulletin, Department of Manpower and Immigration.**

---

[1] Excludes profits (net of losses) of government business enterprises. [2] Includes the withholding tax applicable to this item. [3] Includes profits (net of losses) of government business enterprises and interest ant miscellaneous investment income of government. [4] Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5] Includes net income of independent professional practitioners. [6] See footnote 4, Table 1.2. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

---

[1] Includes defence expenditures. [2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4] The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). [5] See footnote 4, Table 1.1. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars y the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are ffected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter ovements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of rice change. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1] Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. [2] Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3] Withholding taxes. [4] The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. **For source see Table 1. 9.**

---

[1] These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and etween major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar omparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. **For source see Table 1.9.**

---

[1] The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). [2] The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i. e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

See footnotes, Table 3.

*In addition to the selected Labour Force information published here, there are approximately 2,100 Labour Force series available on CANSIM. The series provide basic labour force characteristics, by geographic area, age, sex and marital status.

Table 4: selected series by sex and main age group (thousands of persons)

[1] A vacancy rate is obtained by expressing the number of vacancies per thousand existing jobs (sum of vacant and filled jobs) in all industries, except griculture, fishing and trapping, domestic service and the non-civilian component of public administration and defence. Both full-time and part-time jobs are ncluded. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. **Source: Quarterly eport on Job Vacancies (71-002), Statistics Canada.**

---

[1] In calculating time lost, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as ose laid off as a result of a work stoppage, is not included. [2] The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. om January 1973 forward, the 1970 S.I.C. is used. [3] The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by e number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. [4] The statistics for individual industries clude strikes and lockouts involving fewer than 100 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate d public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. In dition, the total is revised quarterly whereas the individual categories are revised annually. [5] Includes miscellaneous manufacturing industries. [6] Includes blishing and allied industries. [7] Includes storage and communication industries. **Source: Research Bulletin, Labour Canada.**

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the nth. Greater industrial and area detail and more explanatory notes are given in the source publication named below. The Industrial Composite is the sum of all dustries except agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households and blic administration and defence. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1] See footnote 1 and source in Table 10. [2] Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 9. In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. [4] Except machinery and transportation equipment industries.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the ıonth. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2] In addition to those listed, tobacco products; nitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. **Source: Employment Earnings nd Hours (72-002), Statistics Canada.**

[1] The data for the current year are subject to revision. [2] Includes gold. [3] Consists of general wholesale index less animal products and vegetable products component groups. [4] Consists of iron products and non-ferrous metals products component groups less gold. [5] These two series comprise the general wholesale ndex. [6] Excludes gold. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

[1] These rounded weights, provided as a general guide, show the relative importance of the major components of the C.P.I., on average, during the year 1974. [5] Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

Table 1: total inventories, shipments and orders in manufacturing based on the 1970 standard industrial classification (million dollars)

nnual verage nd month	shipments[1]	new orders received during month[2]	unfilled orders at end of month	inventory at end of month						ratio of inventories owned to shipments
						all inventory held				
				owned[3]	held but not owned	**total**	raw materials	goods in process	finished products

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term ntracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. [2] Total new orders received during the period estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3] Total nufacturing inventory owned by manufacturers including warehouse stocks. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), atistics Canada.**

Table 2: manufacturing shipments[1] by industry based on the 1970 standard industrial classification (million dollars)

[1] Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2] Intended for cigarettes. [3] Prior to March 1973 included smoking, chewing and twist. From March 1973 on, includes tobacco intended for pipe smoking only. [4] Includes sales to wholesalers or retailers. [5] Subject to Excise Tax. [6] Includes sales for ships' stores and for export. [7] End of period. **Sources: Tobacco and Tobacco Products Statistics Quarterly (32-014), Production and Disposition of Tobacco Products Monthly (32-022), Statistics Canada; and Department of National Revenue.**

---

[1] 100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. [2] Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. [3] Customs exports. [4] Mill shipments destined for export. **Sources: Pulpwood and Wood Residue Statistics (25-001), Trade of Canada, Exports (65-004), Statistics Canada; Bulletins of Canadian Pulp and Paper Association and Newsprint Association of Canada.**

---

[1] Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to semi finished and rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. [2] Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3] Includes appliances and utensils. [4] Excluding shipments for re-processing at maker's own plant. **Source: Primary Iron and Steel (41-001), Statistics Canada.**

---

[1] Production plus imports less re-exports, minus exports. [2] Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. **Sources: Motor Vehicle Shipments** 42-062), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

---

[1] Barrels of 35 Canadian gallons. [2] Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3] Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4] Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5] Includes inventories at end of period being held at gas plants and in storage caverns. [6] Includes stove oil, kerosene. [7] Includes aviation gasoline and aviation turbo fuel. [8] Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9] Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products. **Source: Refined Petroleum Products (45-004), Statistics Canada.**

---

[1] A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. **Source: Housing Starts and Completions (64-002), Statistics Canada.**

Note: Components may not add to totals due to rounding. [1] The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when th r current annual totals for all firms are known the following year. [2] Excluding trucks. [3] The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. **Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.**

[1] Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as ianging quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of em with price indexes of output can yield misleading indications of the changing relationship of costs and imcome. [2] 1973 and 1974 price indexes are subject to vision. [3] 1974 price indexes are subject to revision. [4] Farm share only of motor vehicles. [5] In addition to the components listed, the major group includes iilding Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6] In addition to components listed, the major group includes Seed, Custom ork, Artificial Insemination, Small Tools and Supplies, and Electricity.

[1] Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2] Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3] Includes baking and frying oils and fats. [4] Includes stocks held by manufacturers and other warehouses. [5] Includes fresh sausage, frankfurters, weiners and all other sausage. [6] Includes solid, coated, bulk, packages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. **Sources: Grain Milling Statistics (32-003), Oils and Fats (32-006),** Quarterly Reports, **Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017) and Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001),** Monthly Report, **Meat and Meat Preparations, Statistics Canada.**

Note: Components may not add to totals because of rounding.

[1] Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities. Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit. [2] Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. [3] Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [4] Personal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5] Includes bank-sponsored credit card balances. [6] The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present: this series is repeated in the unadjusted form. [7] Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. [8] Bills due for non-commercial use of telephones, gas and electric power. [9] Personal cash loans only. The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form. **Sources: Consumer Credit (61-004), Statistics Canada; Bank of Canada; and Department of Insurance.**

---

[1] Column numbers refer to tables 3 and 4 section 11. [2] Includes special transaction-trade, not shown separately. [3] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [4] Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. **Source: Trade of Canada, Exports (65-004), Statistics Canada.**

[1] Column numbers refer to tables 3 and 4, section 11. [2] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3] Includes special transaction-trade, not shown separately. [4] Includes scrap. [5] Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports (65-007), Statistics Canada.**

---

[1] Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. [2] Cargo includes air freight and express but excludes mail and excess baggage. **Sources: Air Carrier Operations in Canada (51-002) Statistics Canada Air Carrier Financial Statements (51-206) Statistics Canada Aviation Statistics Centre (51-004) Statistics Canada.**

[1] Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2] Daily averages for period. [3] Mainly deposits of foreign banks. [4] Capital, rest fund and undivided profits as at the latest fiscal year-end. [5] Including issues payable in foreign currency. [6] Excluding Canadian day-to-day loans. [7] Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8] Loans to grain dealers and exporters. [9] Loans to finance purchase of Canada Savings Bonds at time of issue. [10] Including loans to instalment finance companies. [11] These series reflect the combination of two CANSIM series. **Source: Bank of Canada Review.**

NOTE: Components may not add to totals because rounding. [1]This series was designed to cover 50 clearing house centres. With the advent of centralized a processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; wever, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined. asonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted. **Source: Cheques Cashed in Clearing ntres (61-001), Statistics Canada.**

---

[1] The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. [2] The headings for "bas metals" and "industrial mines" are not found in the Standard Industrial Classification. [3] Combines the industrials, utilities and finance common stocks. [4] Stock included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5] Includes also the machinery industrie (except electrical machinery) and the transportation equipment industries. [6] Stocks included in the mining index are for producing mines. **Source: Price and Price Indexes (62-002), Statistics Canada.**

[1] This statement includes only receipts relating to budgetary revenue. Excluded are non-budgetary revenues such as Old Age Security Fund taxes, Prairie Farm Assistance Act levies, employer and employee contributions to government-held funds (Unemployment Insurance, Superannuation etc.), interest on government-held funds, and taxes collected on behalf of and transferred to other governments. [2] Beginning in December 1973, this category includes oil export tax. [3] March includes supplementary payments arising from the closing of the accounts. **Sources: The Canada Gazette and Dept. of Finance.**

(Continued from page 7)

cent have some elementary and university degree, respectively, compared to corresponding percentages of 32.0 and 3.4 per cent for the reference group.

4. By work experience of head – As one might expect, the "did not work" and "part-time" categories constitute an increasing proportion of the population as one progresses from all families to the reference group and then to the persistent group.

Table 3 presents the data in terms of incidences of low income and the persistence of low income status for unattached individuals and families in 1968 and 1969. The persistence ratio is of particular interest as one can relate the low income persistence to the characteristics sex, age, education and work experience.

The higher persistence ratio observed for unattached individuals than for families reflects the different composition of the two groups, the unattached being composed of a higher proportion of females, the elderly and persons with less work experience than the heads of families. An examination of the persistence ratio by the four characteristics suggests that the ratio is higher for (1) female-headed units, (2) units with older heads, (3) units with less educated heads and (4) units with heads who worked less.

Table 4 looks at the low-income families and unattached individuals according to whether they moved in or out of the low-income status. Four groups are identified: "out-movers" with low income in 1968 but not in 1969; "in-movers" with non-low income in 1968 and low income in 1969; and "non-movers, low income" with low income in both years, and "non-movers, non-low-income" with low-income in neither year. Percentage distributions for each group are presented by sex, age, education and work experience of unattached individuals and family heads.

The following comments relate to families proper by similar conclusions are applicable to unattached individuals.

1. By sex of head – Males constitute a slightly larger proportion of the in-mover population than the out-mover population (91.9 versus 89.3 per cent), albeit an insignificant difference.

2. By age of head – Out-moving families tend to be headed by younger persons than in-moving families. Of in-movers, 11.9 per cent are 70 years of age and over, whereas only 5.4 per cent of out-movers are in the same age groups.

3. By education of head – Movers are more concentrated in the upper educational categories than families who were of low income status both years. Of movers, 11.8 per cent had at least some university compared with only 3.9 per cent of families with low income in both years.

4. By work experience of head (1969) – Families with working heads are more prevalent in the moving group than in the persistent low income group. Full-time workers were more prevalent in the out-mover than in the in-mover group.

Wealth of Low Income Families

Table 5 presents the distribution of "poor" and "non-poor" families by selected financial characteristics based on asset-debt information from the 1970 Survey of Consumer Finance. The data can be summarized very briefly by saying that there are a substantial number of low income families with significant wealth and also a number of non-low income families of little wealth. This suggests that inclusion of wealth in a criterion of financial inadequacy would result in some poor and non-poor families changing places. It should be noted that the majority of families with low income and high net worth own mortgage free homes.

Distribution of Low Income Unattached Individuals and Families by (1) the Liquid Assets/Income Deficit and (2) the Net Worth/Income Deficit Ratios, 1969

Ratio	Unattached individuals		Families	
	Liquid assets[1]	Net worth[1]	Liquid assets[1]	Net worth[1]
	per cent			
1 or less	64.4	50.7	68.2	37.9
1 - 2	7.5	5.3	7.4	6.5
2 - 3	9.1	4.0	4.9	4.6
3 - 4	5.8	2.9	2.3	3.9
4 - 5	2.2	2.5	1.5	3.0
5 or more	16.1	34.6	15.1	44.1
Total	**100.0**	**100.0**	**100.0**	**100.0**

[1] See Appendix for liquid assets and net worth definitions.

If low income status is to some extent a transitory short-term phenomenon then we should perhaps examine the extent to which poor families can cover their income deficit (the amount by which the family income is short of the poverty line). The preceding table examines this deficiency in relation to liquid assets and net worth. These ratios can be interpreted as the length of time the particular type of wealth could compensate for the income deficits. Thus a family with a liquid asset income deficit ratio of two can cover its present deficit for two years. The use of the net worth income deficit criterion results in a much larger proportion of family units able to cover their deficit for five years or more compared to the liquid asset/income deficit criterion. To achieve this would, however, require the selling of the family home in the majority of cases.

Table 6 concludes the wealth analysis with an examination of Mover and Non-mover families of two or more, and unattached individuals for 1968 - 1969. The discussion relates solely to families, although the same characteristics are available for Unattached Individuals.

Variability of homeownership appears to be surprisingly small among the mover and non-mover categories. Homeownership is the lowest among out-movers (54 per cent) and the highest among the group who were poor neither in 1968 or 1969 (64.7 per cent). The lowest proportion of mortgaged homes is found among homeowning families who were poor in both years (this is derived from the table by dividing proportion with mortgage outstanding by the proportion who own a home).

This reflects the concentration of the elderly in the persistently poor group (average age 52 compared to 44 for the persistently non-poor). On the other hand, the average value of the homes for movers and the persistently poor is considerably below that of non-poor families.

Debt (whether total or consumer) is lowest among the persistently poor. In terms of their indebtedness, movers rank consistently between the persistently poor and the non-poor. Whereas the proportion of debtors in the persistently poor group is always lower than in the other groups, the same differential does not show up on the asset side – a higher proportion of the persistently poor has assets than some of the movers. However, the average value of assets of the persistently poor is significantly lower than that of the other groups.

There is a large difference between the persistently poor and movers in respect to automobile ownership. Movers rank between the persistently poor and the non-poor in terms of value and ownership incidence. In part the lower incidence of auto ownership among the persistently poor reflects the greater proportion of elderly families among them.

The final observation from the table concerns the extent to which wealth of the persistently poor is more highly concentrated in homeownership equity compared to the other groups. The homeownership equity-net worth ratios for the four groups are:

	Per cent
Not low income both years	54.9
Low income both years	71.0
1968 low – 1969 non-low.	59.8
1968 non-low – 1968 low.	59.0

Conclusion

This deeper probing into the permanency of low income status and wealth position of the poor was based on special data that are available only at infrequent intervals. The main findings – that among the poor as defined for any one year there is a group of transitory "poor" and that their characteristics differ somewhat from the "hard core poor" as well as the fact that many of the "income-poor" hold substantial amounts of assets – should be of some interest to policy makers. From the point of view of data collectors we can only say that such data are very expensive to collect. For better analysis of the permanency question we would have liked to have true longitudinal data; the cost and other related problems of collecting such data are well known. Asset and debt surveys should be more frequent, particularly in present circumstances where inflation may be motivating families to change their portfolio compositions. Again the cost and response burden problems make it unlikely that wealth information will be more frequently available in the future.

Under these circumstances we see no practical or feasible alternative but to continue with an income based criterion that is supplemented from time to time with analyses in greater depth.

APPENDIX

Definitions

All our terms are defined in the relevant Statistics Canada publications, however, we repeat a few of our main definitions here:

1. Family – A group of individuals sharing a common dwelling unit and related by blood, marriage or adoption.

2. Total income – Money income received during the previous year from the following sources: wages and salaries, net income from self-employment, investment income, government transfer payments and other miscellaneous income. Money income is reported gross of taxes. Income in kind is excluded as are receipts of

gifts, lump sum settlements from insurance policies, income tax or pension refund, capital gains and losses and receipts from the sale of assets.

3. Total assets – The following 13 items constitute total assets:

(a) cash on hand
(b) bank deposits
(c) other deposits
(d) Government of Canada Bonds
(e) other bonds
(f) publicy traded stock
(g) shares in investment clubs
(h) other financial assets – mortgage holdings and other
(i) miscellaneous assets – loans to other persons and other
(j) market value of home
(k) market value of vacation home
(l) investment in other real estate
(m) value of automobiles.

4. Liquid asset holdings are the sum of (a) to (e) above.

5. Total debt consists of the following items:

(a) charge account and installment debt
(b) secured bank loans
(c) other collateral bank loans
(d) home improvement loans
(e) other bank loans
(f) loans from consumer loan companies
(g) loans from Credit Unions and Caisses populaires
(h) other institutional loans
(i) miscellaneous debts and loans
(j) mortgage debt on homes
(k) mortgage debt on vacation homes.

6. Consumer debt – Sum of items (a), (c), (e), (f), (g) above.

7. Personal debt – Sum of items (a) to (i).

8. Net worth is the difference between total assets and total debt.

impact in the recalculations. The evidence up to now suggests, therefore, that for most practical purposes the regular CPI is representative of a wider range of income groups than just the target group, since even marked differences in consumption patterns for the various income groups would not appear to result in significantly different CPIs. By the same token, the standard CPI appears to be a suitable deflator in attempts to determine changes in real income and expenditure trends and distributions.

In doing so, it must be recalled that the CPI is a baseweighted price index, which indicates the change in the cost of a constant or equivalent basket of goods. This distinguishes it from a cost-of-living index. The latter would be designed to measure the changes in the cost of a constant level of well-being or utility. In maintaining a constant level of utility, consumers would tend to substitute items in their basket as relative prices change. This substitution effect is not taken into account in measuring the CPI. Also, substitution of items may vary for different income groups, with the higher income families having more scope for substitution than the lower.

It should also be kept in mind when using the CPI as a deflator (or inflator), that certain items in the consumer basket are not priced, the largest being the services provided by various governments and institutions. The differential impact on various income groups, due to cost increases in this area, is also not known.

CANADIAN STATISTICAL REVIEW

Cette revue est disponible en édition française. Revue Statistique du Canada nº 11-003F au catalogue.

Series published in this Review are available from CANSIM, the computerized time series data bank of Statistics Canada, on printouts or in machine-readable form for use on computers. Identification numbers given as a reference at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada. It should be noted that all time series in CANSIM are regularly updated as new or revised data are released. Annual figures are also available from CANSIM, more information can be found in the *CANSIM Summary Reference Index* and the *CANSIM Series Directory*. Both the documents are available directly from CANSIM staff.

Seasonal Adjustment

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant.

Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation caused by the difference in the number of working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series still contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

NOTE TO USERS

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Section 3, Table 1.7 – Income and Expenditure Accounts

The series personal direct taxes – local, CANSIM numbers 40061 and 40299, have been deleted with this issue at the request of the source.

Section 3, Table 2 – Indexes of Real Domestic Product by Industry

Users should note that the Indexes of Real Domestic Product by industry are on a 1971 weight and reference base and follow the 1970 Standard Industrial Classification (SIC). Monthly, quarterly and annual data for the period 1971 to date are available on CANSIM in the following matrices: Monthly – 1122; Quarterly – 1123; Annual – 1124. These data will also appear in the publication *Real Domestic Product by Industry (1971 = 100)* (61-213) for the period 1971-74 and in the October 1975 issue and subsequent issues of *Indexes of Real Domestic Product by Industry* (61-005) for 1975.

Section 5, Table 3 – Other Price Indexes

With this issue the Canadian farm products series have been rebased form 1935-39 = 100 to a 1971 base. Series on the 1935-39 base will continue to be available from CANSIM although they will not be updated and the series on the 1971 base can be found under the new CANSIM numbers listed.

This Review and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, Ont., K1A 0T6 Canada, and remittances made payable to the Receiver General for Canada. PILOT PROJECT ON STATISTICS OF CORPORATE TAKEOVERS IN THE CANADIAN ECONOMY, 1970 - 1971

Questions regarding the extent and importance of company takeover activity in Canada frequently go unanswered because of the lack of statistical studies in this area.[1] This shortcoming is not an oversight on the part of statisticians but a reflection of the difficulties, both at the practical and the conceptual level, in the construction of series that would help answer some of the questions.

This article represents the results of an exploratory probe made by the Multinational Enterprises Section into the feasibility of constructing a statistical series on company takeovers, using material already available. It is intended that this work lay the foundation for subsequent development and possible regular publication of statistics in this area. If the latter should prove feasible, the results would assist research in the areas of industry rationalisation, monopoly power and the dynamics of industry concentration, although it must be recognized that this information constitutes only one part of the picture. It should also be recognized that the focus of the note is not especially on foreign takeover activity and to the extent that figures on takeovers of Canadian corporations by foreigners are given, it presents only one side of the picture. It does not identify the takeover of previously foreign-controlled Canadian corporations by Canadians. Takeovers of corporations located outside Canada are omitted from the tables.

Before describing the sources and methods used in constructing the series and the qualifications that need to be attached to the figures, a brief summary of the statistical results of the study follows.

Statistical Results

Data have been assembled initially for two 12-month periods, covering takeovers which occurred in 1970 and 1971. For these two periods corporation takeover activity has been isolated and an attempt has been made to provide a profile of both the acquired companies and the acquiring businesses.

In 1970 the 422 corporations acquired had average sales of \$2.4 million and the 377 corporations acquired in 1971 averaged sales of \$3.0 million. The average sales of corporations undertaking the acquisitions were \$25.9 million and \$40.9 million in 1970 and 1971; however, these figures relate only to acquiring corporations incorporated in Canada and exclude foreign-based corporations.

In both years the numbers of corporations taken over were fairly equally divided in number between those acquired by Canadian-controlled corporations and those foreign controlled. Overall the average sales of those companies acquired by Canadian-controlled corporations were slightly higher.

In 1970 and 1971 the largest number of takeovers occurred in the manufacturing industry, accounting for 41 per cent and 34 per cent respectively of the total acquisitions and representing assets valued at \$417 million in 1970 and \$362 million in 1971. The average profits of manufacturing corporations taken over in 1970 were \$153 thousand with a lower average profit picture for those taken over by U.S.-controlled corporations than for Canadian and other foreign-controlled acquiring companies. In 1971 average profits were slightly higher at \$187 thousand.

In terms of asset size there were nine corporations acquired in 1970 with assets over \$25 million and seven in 1971. The asset size group within which corporate acquisitions were most frequent was the \$1 - 5 million group, with 145 and 136 takeovers in 1970 and 1971 respectively. It should be noted that in 1970 the average assets of corporations acquired in the finance industry are somewhat distorted by the takeover by a Canadian-controlled corporation of a single large institution. This single transaction also affects the totals significantly.

---

[1] One such study of the takeover of Canadian firms between 1945 - 61 was prepared for the Economic Council of Canada by Grant L. Reuber and Frank Roseman and published in 1969 by the Council as Special Study No. 10.

Financial data are available only for those acquiring corporations based in Canada. In both the years the average asset size, sales and profits of foreign-controlled companies were generally about three times greater than for the Canadian-controlled corporations.

In most cases the frequency of takeovers by the acquiring corporations for a single year was limited to one, although cases of two and three acquisitions by one corporation were not uncommon. At the extreme end of the frequency distribution, two U.S. based corporations acquired eight and 13 corporations respectively in 1970, and in 1971 one Canadian controlled and one U.S.-controlled company based in Canada each acquired seven corporations.

Because of the wide variation in some of the figures embodied in the attached tables and the limited number of corporations in certain industries and size distributions the averages given should be regarded with caution. The relatively greater stability of assets and sales make comparisons between 1970 and 1971 more meaningful than for profits, which exhibit much greater volatility. Between 1970 and 1971 both total corporate sales and assets grew by 10 per cent, while net profits before taxes rose by 20 per cent.

Sources and Methods

The following section describes the methods used in the study, the sources of basic data and notes certain qualifications attaching to the results. Suggestions are also made regarding future work in this field.

First, it should be emphasized that the series represent **corporate** takeover activity in Canada, i.e., a change in control of a corporate legal entity. The acquiring party need not necessarily be another corporation but only in the case where a corporation changes hands would the acquisition be reflected in the series that are presented. The latter restriction was to a large extent predetermined by the availability of raw data. Business combinations may occur in several forms, including outright purchase of assets or operations, or amalgamation in which two or more firms merge, giving up their previous identities. In this study only corporate takeovers have been considered, in which one firm, maintaining its own identity, acquires other firms which may or may not lose their identity. Another quantitatively important type of takeover activity is the divisional acquisition and spinoff, whereby only a part of the physical assets or activities of a legal entity are involved in the transaction. With the increasing size and diversification of companies it is to be expected that often a company will wish to spinoff certain of its activities that are unprofitable or no longer fit its business strategy due to changing management or competitive conditions. It has not been possible in this developmental study to quantify such types of takeover-like activity but this is one of the research avenues open in any future work in this area. In the study by Reuber and Roseman such divisional acquisitions were found to represent, in terms of numbers, 15 per cent of acquisitions by foreign and 6 per cent of acquisitions by Canadian-controlled companies.

A change in control is considered to have taken place when majority interest in a company changed from one party to another. This usually involved acquisition of 50 per cent or more of voting stock of another company, or acquisition of less than 50 per cent of voting stock of another company where (i) other information shows that the purchase will bring acquirer's share up to more than 50 per cent, or (ii) effective control was publicly acknowledged to have passed to acquirer with less than 50 per cent. It is realized though that the statistical notion of control is at best an imprecise one so that the series may count some companies as having been taken over, through acquisition of voting rights, when in fact they were effectively controlled previously by the acquiring party through a minority share ownership. On the other hand the series does not include majority-owned subsidiaries of companies taken over due to the resource limitations placed on the project, and to this extent takeover activity has been understated. It should be noted that in the case of the series on assets of acquired companies, these will include investment in affiliates. The series includes joint ventures which changed to wholly or majority-owned corporations, but excludes purchases of unincorporated businesses, including foreign branch operations.

Despite the above shortcomings in the series, the results are judged to represent a reasonable first step towards measuring takeover activity. Almost certainly all large takeovers were accounted for. The most serious shortcomings include the omission of information on acquisitions other than through changes in share ownership, including divisional spinoffs, and the lack of information on the majority-owned subsidiaries of companies taken over. Both these limitations require further examination – the former is probably not amenable to easy solution, whereas the latter is.

Three basic sources were used in the difficult task of identifying takeovers and the names of the corporate entities involved: (i) the register maintained by the Department of Consumer and Corporate Affairs (CCA) of all press reported takeovers, (ii) the records maintained from information collected under the Corporations and Labour Unions Returns Act on changes in ownership, and (iii) the annual Census of Manufactures in Canada special question on ownership changes. Supplementary information for checking takeovers included the Financial Post Corporation Service card index and the Standard and Poor's directory.

Certain problems were encountered in using the basic source material, including exemption from reporting under CALURA by companies with assets not in excess of $1/4 million or gross revenues not in excess of $1/2 million during the reporting period and the lack of an independent means of assessing the completeness of the CCA register. These factors may account for some underestimation of takeovers involving small companies; the number of these would however be relatively more important than any of the financial variables associated with them. It was also discovered that the CCA register contained some reported takeovers which in fact could not be substantiated or which occurred in another year.

Having identified both the acquired companies and the acquiring parties, the two groups were then subdivided by country of control using CALURA ownership information. It should be recognized that the CALURA information is based primarily on the country of control of the first foreign parent. Acquired corporations were identified as having been taken over by a Canadian-controlled company, a U.S.-controlled company, or by a company controlled elsewhere. Tables are not provided which subdivide acquired companies on the basis of where they were controlled prior to their having been taken over. It is recognized that for many purposes this information would be of value and subsequent work should attempt to draw this distinction.

In general it is the acquiring corporation which has been used to determine country of control. In certain cases where the takeover was by a non-corporate entity it has been assigned to the country of residence of the individual. In cases of takeovers by foreign based corporations it has been assumed that control rests in the country of residence of the acquiring corporation.

In matching identified companies and specific financial data, the compilations were restricted to numbers of companies and three economic variables – total assets, sales and profits. The data presented in the tables cover only the year in which the takeover took place. The definitions of the financial items are those used in CALURA annual reports.[2] Profits comprise net earnings from operations plus investment income and net capital gains, less allowances for amortization, depreciation and depletion but before provisions for income tax or declaration of dividends. The assets item includes cash, marketable securities, accounts receivable, inventories, fixed assets, investments in affiliated companies and other assets. "Sales" represents gross revenues from non-financial operations except in the case of financial corporations where the figure represents income derived from both financial and non-financial sources.

Unfortunately, in the case of acquiring companies resident outside Canada, it was not possible to assemble financial data comparable to that available for Canadian resident companies. Because of both the problem of access and comparability, financial data for this group of companies are not provided. Future development work should examine the possibility of deriving information from foreign published sources, such as the Securities and Exchange Commission in the United States or various directories and registers such as Moody's or Standard and Poor's.

Data are not available on the terms, method or purchase price associated with the takeover. These remain important gaps in the statistics.[3] However, short of a special survey of the companies involved, it would be impossible to assemble this information.

The data are presented at the major industry division level, largely for reasons of confidentiality; even so, some cells in the tables have had to be suppressed. The groupings follow those used in the CALURA report and are based on the 1960 Standard Industrial Classification. It should be noted that this classification standard has been revised and updated as of 1970, but this revision had virtually no impact at the broader levels of aggregation.

As noted in the introduction, this article represents only an exploratory probe into the relatively uncharted waters of takeover activity but it is hoped that it has pointed the way to further work and has opened up certain new vistas in the field.

---

[2] Annual report under the *Corporations and Labour Unions Returns Act (CALURA) 1971, Part I,* Catalogue 61-210, Statistics Canada, Ottawa.

[3] To the extent that takeovers involve capital transfers from abroad these are, however, captured within the balance of payments.

TABLE 1. Canadian Corporations Acquired by Corporations[1] Controlled . . .

Industry of acquired corporation		In Canada	In United States[2]	In all other countries[2]	Total
Agriculture, forestry, fishing and trapping	1970	x	x	x	x
	1971	3	x	x	4
Mines, quarries and oil wells	1970	16	9	x	x

OBSERVATIONS

Appointments

There have been three new appointments in User Advisory Services Division:

Mr. Bill Pawluck, who was Regional Advisor, St. John's, Newfoundland, has been appointed Regional Advisor, Halifax, Nova Scotia effective January 15, 1976. Ms. Cathy MacNutt will replace Bill Pawluck in Halifax while he is on language training.

Mr. David Courtney has been appointed as the new Regional Advisor for St. John's, Newfoundland, effective January 12, 1976.

Mr. André Gallant, has been appointed Head, Central Inquiries in Ottawa, effective January 19, 1976.

Canadian Provincial Economic Accounts

In a country as large and diverse as Canada, comprehensive regional statistics are crucially important to both public and private policymakers. In the public sphere, tax-sharing agreements, industrial development grants and subsidy programs are all influenced by regional economic conditions. The private sector is similarly affected. Decisions about locating new plants, expanding existing facilities and other aspects of market development depend on economic conditions and prospects. Provincial income and expenditure accounts comprise the core of the regional data base that is required in these activities.

At the recent conference of Commonwealth Statisticians, Statistics Canada presented a paper summarizing its current research program to develop a set of Canadian provincial economic accounts.

As early as 1946, Statistics Canada (then the Dominion Bureau of Statistics) included in its first national accounts publication a provincial breakdown of labour income and net income of unincorporated business. In 1949, the provincial details of total personal income and its major components were incorporated in the official statistical publications.

Between the years 1950 to 1972, further extensions of the provincial dimension were largely prevented by conceptual and statistical problems. In 1957 and 1967 provisional estimates for the income side of the accounts were prepared on a provincial basis, but on both occasions the estimates were not released "as they were not judged to be of sufficient reliability".[1] Interest in provincial accounts grew rapidly during this period, however, and in the absence of relevant data from Statistics Canada, some provinces and federal departments undertook to produce their own. The Atlantic Provinces, through the medium of the Atlantic Provinces Economic Council, were among the first to do so.

Initially, estimates of Gross Provincial Product were based on personal income statistics by province, as published by Statistics Canada, plus fairly primitive estimates of profits, interest, capital consumption allowances and indirect taxes less subsidies. Provincial accounts of a more sophisticated nature have appeared in recent years. Ontario has produced two sets of income and expenditure accounts using both the national and the domestic concepts. A number of provinces have published provincial accounts on a domestic basis and other provinces are in the process of doing so. The degree of refinement and disaggregation is, however, non-uniform and varies in quality from province to province.

The sharp rise in demand for consistent subnational data that could in a practical sense be compiled only at a central statistical agency led Statistics Canada to the conclusion that it must revive and expand its efforts to provide a complete set of provincial economic accounts on a regular basis. In a report to a Federal-Provincial Conference on Economic Statistics in 1973, this was announced as a matter of policy. In order to benefit from the considerable experience already acquired by provincial statisticians, it was decided to make the project a joint federal-provincial undertaking.

---

[1] H.J. Adler, "Approaches to Regional Economic Accounting in Canada", *The Review of Income and Wealth*, June 1970, p. 187.

For the achievement of these objectives, Statistics Canada is in the process of estimating, in conjunction with the provinces, provincial Gross Domestic Product figures using both the sum of incomes and sum of expenditures approaches. These provincial and national series are calculated by breaking down (often referred to as "building down") national aggregates in order to ensure interprovincial comparability and consistency with the national totals, at a suitable level of disaggregation.

The preparation of this system of provincial accounts has required considerable effort not only in searching for, and assembling the massive set of available data, but also in defining new methods of allocating provincially, national series and in resolving conceptual problems. Estimates for most of these figures have already been tabulated for the years 1961 to 1971 and presented to the provinces and territories for discussion.

For more detailed information please contact Joël Diena, project leader, Gross National Product Division, Statistics Canada (613-995-0611).

Job Search Patterns in Canada

Job Search Patterns in Canada, by David E. Gower (Catalogue 71-525E, Occasional) is one of the Special Labour Force Studies. This study used data from a supplemental attached to the October 1971 Labour Force Survey to study the patterns of job search and job success of persons in the labour market.

It begins by reviewing the role of job search in labour market theory, and then presents an overview of the job search population, pointing out the concentration of searchers among younger people and among persons with lower levels of skill.

The circumstances of people at the point of entry into job search were examined, and the general conclusion arrived at that older searchers were more likely to be searching involuntarily than younger ones.

The outcome of the job searches was studied. Younger searchers and prime-age males were observed to have much better success than others, measured by three different criteria; length of search, outcome of search, and amount of unemployment during search.

The relationship between education and search success was examined. While education seemed to be an advantage to younger job searchers, for older searchers it made little difference. This finding accentuated the general impression that older searchers are severely disadvantaged in the labour market.

A check was made in the data to see if prolonged unemployment caused workers to lower their job expectations. Using acceptance of a part-time or temporary job as a criterion, evidence was found that such lowering does take place.

Finally, the choice of search method and the intensity of use were examined. While it was found that there was a positive relationship between search effort and success, interpretation of this was complicated by the fact that the same groups that showed the highest search effort are the same groups who proved to have favourable search outcomes: the young and better educated. The study concludes, therefore, that it is not possible to isolate search effort from such personal factors as age and education in determining precisely what causes success or failure in job search.

More information on this study is available from David Gower, Labour Force Survey Division, Statistics Canada (613-992-1358). Copies of *Job Search Patterns in Canada* may be ordered from Publications Distribution, Statistics Canada, Tunney's Pasture, Ottawa, K1A 0T6 (Price: $1.05).

[1] [illegible] determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census [illegible] mechanical and construction. [4] Includes a small number of non-specified occupations. [5] Does not include students entering Canada on students' visas. [6] Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. **Source: Quarterly Bulletin, Department of Manpower and Immigration.**

---

[1] Excludes profits (net of losses) of government business enterprises. [2] Includes the withholding tax applicable to this item. [3] Includes profits (net of losses) of government business enterprises and interest ant miscellaneous investment income of government. [4] Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5] Includes net income of independent professional practitioners. [6] See footnote 4, Table 1.2. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1] Includes defence expenditures. [2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4] The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). [5] See footnote 4, Table 1.1. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1] Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are eated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of ie treatment of insurance. [2] Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3] Withholding taxes. The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have een generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. **For source ee Table 1. 9.**

---

[1] These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and etween major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar omparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. **For source see Table 1.9.**

---

[1] The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). [2] The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

See footnotes, Table 3.

*In addition to the selected Labour Force information published here, there are approximately 2,100 Labour Force series available on CANSIM. The series provide basic labour force characteristics, by geographic area, age, sex and marital status.

Table 4: selected series by sex and main age group (thousands of persons)

---

[1] A vacancy rate is obtained by expressing the number of vacancies per thousand existing jobs (sum of vacant and filled jobs) in all industries, except griculture, fishing and trapping, domestic service and the non-civilian component of public administration and defence. Both full-time and part-time jobs are ncluded. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. **Source: Quarterly eport on Job Vacancies (71-002), Statistics Canada.**

---

[1] In calculating time lost, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as hose laid off as a result of a work stoppage, is not included. [2] The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. rom January 1973 forward, the 1970 S.I.C. is used. [3] The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by he number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. [4] The statistics for individual industries xclude strikes and lockouts involving fewer than 100 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate nd public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. In ddition, the total is revised quarterly whereas the individual categories are revised annually. [5] Includes miscellaneous manufacturing industries. [6] Includes ublishing and allied industries. [7] Includes storage and communication industries. **Source: Research Bulletin, Labour Canada.**

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2] Excludes agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households, public administration and defence. [3] Includes storage, electric power, gas and water utilities. [4] Excludes domestic service. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. The Industrial Composite is the sum of all industries except agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households and public administration and defence. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1] See footnote 1 and source in Table 10. [2] Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 9. In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. [4] Except machinery and transportation equipment industries.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2] In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

---

[1] These rounded weights, provided as a general guide, show the relative importance of the major components of the C.P.I., on average, during the year 1974. [5] Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

Table 1: total inventories, shipments and orders in manufacturing based on the 1970 standard industrial classification (million dollars)

nnual verage nd month	shipments[1]	new orders received during month[2]	unfilled orders at end of month	inventory at end of month						ratio of inventories owned to shipments
						all inventory held

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term ntracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. [2] Total new orders received during the period estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3] Total nufacturing inventory owned by manufacturers including warehouse stocks. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), itistics Canada.**

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufactures values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.**

[1] Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2] Intended or cigarettes. [3] Prior to March 1973 included smoking, chewing and twist. From March 1973 on, includes tobacco intended for pipe smoking only. [4] Includes sales to vholesalers or retailers. [5] Subject to Excise Tax. [6] Includes sales for ships' stores and for export. [7] End of period. **Sources: Tobacco and Tobacco Products tatistics Quarterly (32-014), Production and Disposition of Tobacco Products Monthly (32-022), Statistics Canada; and Department of National Revenue.**

[1] 100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. [2] Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. [3] Customs exports. [4] Mill shipments destined for export. Sources: Pulpwood and Wood Residue Statistics (25-001), Trade of Canada, Exports (65-004), Statistics Canada; Bulletins of Canadian Pulp and Paper Association and Newsprint Association of Canada.

---

[1] Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to semi finished and rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. [2] Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3] Includes appliances and utensils. [4] Excluding shipments for re-processing at maker's own plant. **Source: Primary Iron and Steel (41-001), Statistics Canada.**

---

[1] Production plus imports less re-exports, minus exports. [2] Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. **Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.**

---

[1] Barrels of 35 Canadian gallons. [2] Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3] Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4] Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5] Includes inventories at end of period being held at gas plants and in storage caverns. [6] Includes stove oil, kerosene. [7] Includes aviation gasoline and aviation turbo fuel. [8] Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9] Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products. **Source: Refined Petroleum Products (45-004), Statistics Canada.**

[1] In 1975, approximately 1,600 municipalities are being surveyed.

[2] This is an historical series with data available back to 1920. Consistent coverage and volume have been maintained so historical comparisons are possible.

---

[1] A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan [illegible] or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. **Source: Housing Starts and Completions (64-002), Statistics Canada.**

[1] In this context, "softwood" refers to wood from coniferous trees, and hardwood to wood from broadleafed species. [2] Includes export shipments; the softwood umber column includes estimates for Manitoba, Newfoundland and P.E.I. [3] Shipments by principal manufacturers. Total domestic shipments are somewhat higher. [4] Production for these items. As reported by principal manufacturers. Total production is somewhat higher. [5] Building contractors, public and utility construction and structural steel fabricators. **Sources: Peeler Logs, Veneers, and Plywoods (35-001), Production, Shipments and Stocks on Hand of Sawmills East of the Rockies (35-002), Production, Shipments and Stocks on Hand of Sawmills in B.C. [1] Cash receipts from farming operations excluding supplementary payments. Excludes Newfoundland. [2] Represents participation payments made by the Canadian Wheat Board direct to producers on crops delivered in previous years. [3] Includes rye, flaxseed, rapeseed, soybeans and corn. [4] Includes clover and grass seed, hay, clover, greenhouse products, mustard seed, sunflower seed, hops, dry beans and dry peas and miscellaneous products. [5] Made under the authority of the Agricultural Stabilization Act. **Source: Farm Cash Receipts (21-001), Statistics Canada.**

Note: Components may not add to totals due to rounding. [1] The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when their current annual totals for all firms are known the following year. [2] Excluding trucks. [3] The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. **Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.**

[1] Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as hanging quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of hem with price indexes of output can yield misleading indications of the changing relationship of costs and imcome. [2] 1973 and 1974 price indexes are subject to evision. [3] 1974 price indexes are subject to revision. [4] Farm share only of motor vehicles. [5] In addition to the components listed, the major group includes uilding Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6] In addition to components listed, the major group includes Seed, Custom ork, Artificial Insemination, Small Tools and Supplies, and Electricity.

---

[1] Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2] Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3] Includes baking and frying oils and fats. [4] Includes stocks held by manufacturers and other warehouses. [5] Includes fresh sausage, frankfurters, weiners and all other sausage. [6] Includes solid, coated, bulk, packages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. **Sources: Grain Milling Statistics (32-003), Oils and Fats (32-006),** Quarterly Reports, **Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017) and Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001),** Monthly Report, **Meat and Meat Preparations, Statistics Canada.**

Note: Components may not add to totals because of rounding.

[1] Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities. Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit. [2] Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. [3] Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [4] Personal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5] Includes bank-sponsored credit card balances. [6] The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present: this series is repeated in the unadjusted form. [7] Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. [8] Bills due for non-commercial use of telephones, gas and electric power. [9] Personal cash loans only. The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form. **Sources: Consumer Credit (61-004), Statistics Canada; Bank of Canada; and Department of Insurance.**

---

[1] Column numbers refer to tables 3 and 4 section 11. [2] Includes special transaction-trade, not shown separately. [3] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [4] Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. **Source: Trade of** Canada, Exports (65-004), Statistics Canada.

[1] Column numbers refer to tables 3 and 4, section 11. [2] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3] Includes special transaction-trade, not shown separately. [4] Includes scrap. [5] Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports** (65-007), Statistics Canada.

---

[1] Data for 1970 through 1972 refer to 24 class 1 and 2 carriers whose gross annual revenues totalled $500, 000 or more. Commencing January 1973, only 6 major railways (accounting for 95 per cent or more of the total operating revenues) are shown. **Source: Railway Operating Statistics (52-003), Statistics Canada.**

---

[1] Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. [2] Cargo includes air freight and express but excludes mail and excess baggage. **Sources: Air Carrier Operations in Canada (51-002) Statistics Canada Air Carrier Financial Statements (51-206) Statistics Canada Aviation Statistics Centre (51-004) Statistics Canada.**

[1] Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2] Daily averages for period. [3] Mainly deposits of foreign banks. [4] Capital, rest fund and undivided profits as at the latest fiscal year-end. [5] Including issues payable in foreign currency. [6] Excluding Canadian day-to-day loans. [7] Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8] Loans to grain dealers and exporters. [9] Loans to finance purchase of Canada Savings Bonds at time of issue. [10] Including loans to instalment finance companies. [11] These series reflect the combination of two CANSIM series. **Source: Bank of Canada Review.**

NOTE: Components may not add to totals because rounding. [1] This series was designed to cover 50 clearing house centres. With the advent of centralized a processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; wever, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined. asonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted. **Source: Cheques Cashed in Clearing ntres (61-001), Statistics Canada.**

---

[1] The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. [2] The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3] Combines the industrials, utilities and finance common stocks. [4] Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5] Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. [6] Stocks included in the mining index are for producing mines. **Source: Prices and Price Indexes (62-002), Statistics Canada.**

---

[1] This statement includes only receipts relating to budgetary revenue. Excluded are non-budgetary revenues such as Old Age Security Fund taxes, Prairie Farm Assistance Act levies, employer and employee contributions to government-held funds (Unemployment Insurance, Superannuation etc.), interest on government-held funds, and taxes collected on behalf of and transferred to other governments. [2] Beginning in December 1973, this category includes oil export tax. [3] March includes supplementary payments arising from the closing of the accounts. **Sources: The Canada Gazette and Dept. of Finance.**

CANADIAN STATISTICAL REVIEW

Cette revue est disponible en édition française. Revue Statistique du Canada n^o 11-003F au catalogue.

Series published in this Review are available from CANSIM, the computerized time series data bank of Statistics Canada, on printouts or in machine-readable form for use on computers. Identification numbers given as a reference at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada. It should be noted that all time series in CANSIM are regularly updated as new or revised data are released. Annual figures are also available from CANSIM, more information can be found in the *CANSIM Summary Reference Index* and the *CANSIM Series Directory*. Both the documents are available directly from CANSIM staff.

Seasonal Adjustment

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant.

Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation caused by the difference in the number of working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series still contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

SYMBOLS

The following standard symbols are used in this and other Statistics Canada publications:

. . figures not available.

. . . figures not appropriate or not applicable.

- - amount too small to be expressed.

– nil or zero.

† advance estimates.

c correction

p preliminary figures.

r revised figures.

x confidential to meet secrecy requirements of the Statistics Act.

MCD months for cyclical dominance (see above).

NOTE TO USERS

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

New format for the Canadian Statistical Review

This issue is the last one to appear under this format.

The new *Canadian Statistical Review* will be introduced with the April issue in a format composed and printed by the newest methods offered. The most noticeable changes will be a new cover and different typography. Information on the technical changes will be available in the Observations of the April issue.

Section 4, Table 3 to 5 – Labour Force

These tables have not been updated with this issue. This block of data is currently being changed on CANSIM to reflect the new labour force survey, recently released.

Section 5, Table 1 – Industry Selling Price Index

This table has not been updated with this issue. Currently the data is being converted on CANSIM to the 1970 standard industrial classification.

This Review and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, Ont., K1A 0T6 Canada, and remittances made payable to the Receiver General for Canada. For further information, direct inquiries to:

Ottawa, K1A 0T6.

NATIONAL INCOME AND EXPENDITURE ACCOUNTS

Fourth Quarter and Preliminary Annual 1975

Introductory Review

The economic recovery continued in the fourth quarter of 1975, but at a substantially slower pace than that experienced in the early stages of previous upswings, as Gross National Product, seasonally adjusted at annual rates, increased by 2.8 per cent to $161.9 billion. In real terms – that is, after adjustment for price changes – Gross National Product increased by 0.4 per cent, which is well below what might be considered normal by historical standards for a post-recession period, and also less than the rates of growth achieved in the second and third quarters. Nevertheless, the fourth quarter displayed a number of characteristics typical of early recovery periods, as increases in personal expenditure and residential construction supplied most of the real growth, and imports grew faster than exports leading to a deterioration in the trade balance. Heavy inventory liquidation continued, and again, this is usual early in recoveries; however, the very large volume of stocks accumulated in 1974 and late 1973, which probably acted to delay the start of the recession in Canada, now appears to be exerting a stronger than normal restraint on recovery. Real final domestic demand, which excludes the value of the physical change in inventories and exports of goods and services, was much stronger than real Gross National Product and increased by 1.6 per cent.

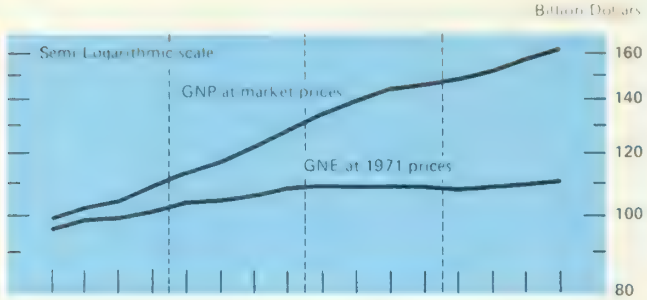
Incomes

The fourth quarter weakness was reflected by a very moderate 1.6 per cent increase in wages, salaries and supplementary labour income, which is by far the largest component of Gross National Product. This rate of increase is considerably less than the average rate of growth in labour income through the recession and in fact, represents the lowest rate of increase since the second quarter of 1970. However, to some extent this weakness is misleading, since it follows the payment of large cost-of-living allowances in the third quarter; these payments had the effect of raising the third quarter growth rate at the expense of the fourth, and, if they were excluded, the fourth quarter growth would have been a much more normal 3.5 per cent. The rise in labour income was concentrated in the goods-producing industries, as income in the service-producing industries was virtually unchanged, and was almost entirely a result of an increase in average earnings rather than employment. In terms of the distribution of Gross National Product, labour income's share fell slightly.

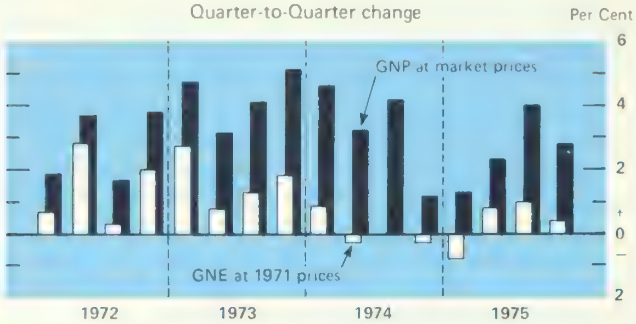
Profit's share of Gross National Product also declined very slightly in the fourth quarter, as corporation profits before taxes grew by 1.9 per cent to $18.6 billion. Increases in most major industrial groups were marginal; within manufacturing, the largest gains occurred in wood, printing and publishing, metal fabricating, and non-metallic minerals. Of the non-manufacturing industries, communications and utilities recorded the largest increases. Corporate retained earnings were unchanged from the third quarter.

Accrued net income of farm operators from farm production was the only income component to decline in the fourth quarter, falling by over 20 per cent to $3.3 billion; however, much of this decline was due to a drop in the accrued value of crop production, and net income received by farm operators increased by 4.7 per cent. Net income of non-farm unincorporated business grew by a very strong 5.2 per cent as there were large increases in the income of small retailers and unincorporated construction companies, and a somewhat smaller percentage increase in rents. There was also a substantial fourth quarter rise in interest and miscellaneous investment income. Together with a 2.8 per cent increase in government transfers to persons, the growth in these sources of income partially compensated for the weakness in wages and salaries and resulted in an increase of 2.3 per cent in personal income; as transfers to government decreased as a result of lower income tax collections, personal disposable income grew by 3.2 per cent to $108.0 billion. This increase was accompanied

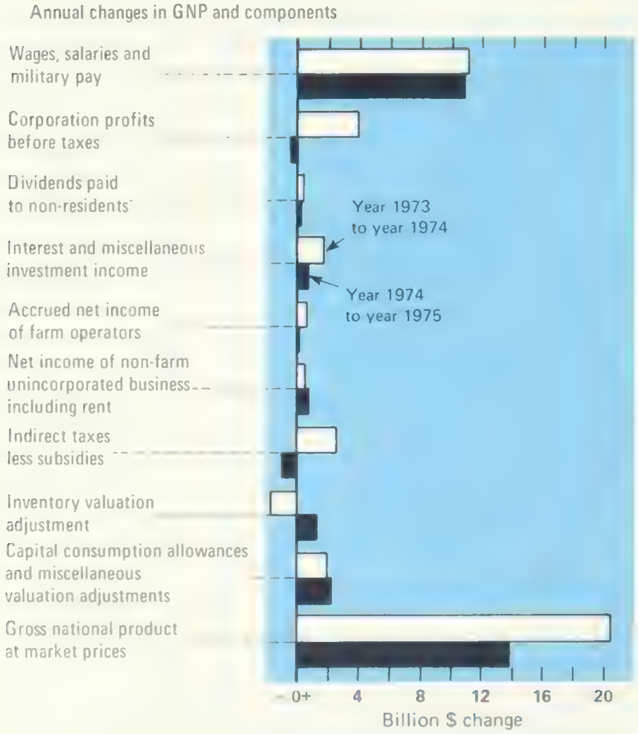
GNP in 1975 was $154.8 billion, an increase of 9.8% from the level of the previous year. Real output in the economy increased by a mere 0.2%.



GNP in the fourth quarter in real terms increased by 0.4%, less than the rates of growth achieved in the second and third quarters.

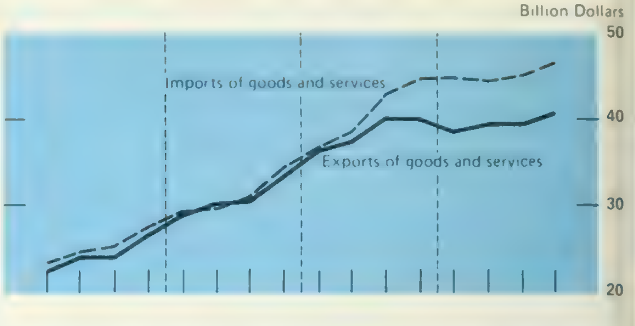


Labour income rose by 14.0% in 1975, compared with an increase of 16.9% in 1974. Corporation profits before taxes fell by 2.9%, the first decline since 1970.

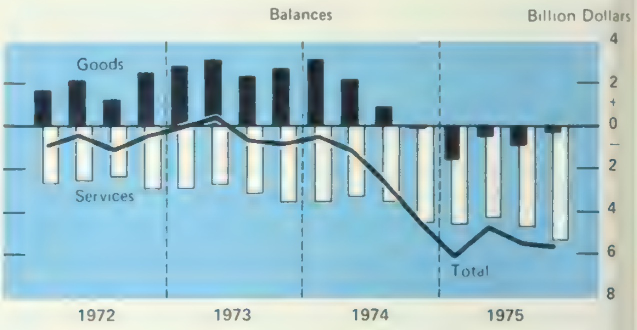


All quarterly data adjusted for seasonal variation and at annual rates.

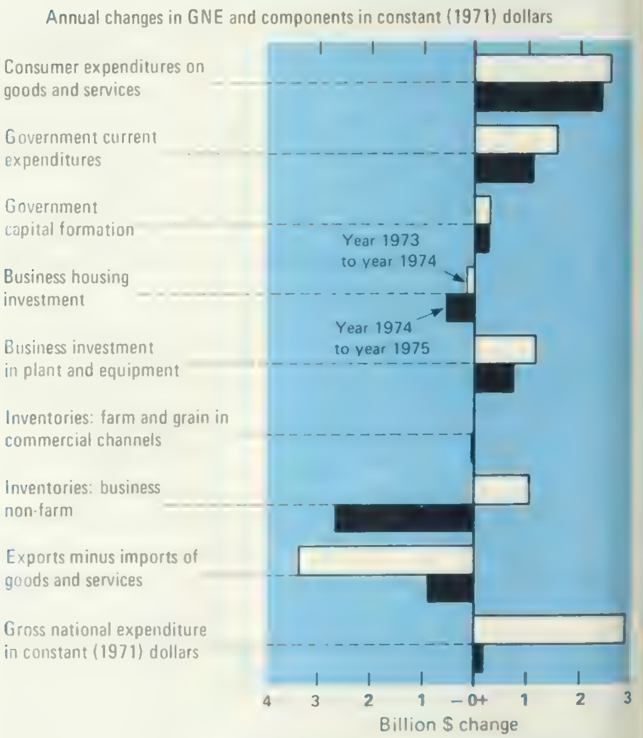
The external sector was one of the major sources of weakness in 1975. Exports rose 3.0% while imports were up 11.0%, resulting in a $3.3 billion deterioration in the trade balance,



In the fourth quarter, an improvement on the goods account was offset by a deterioration of $0.7 billion in the services deficit, resulting in a slight deterioration in the overall trade balance.



Investment in residential construction and exports of goods and services both declined in real terms in 1975; there was a dramatic swing in inventories of $2.8 billion, and personal expenditure recorded its smallest real growth since 1970.



by a 3.9 per cent rise in expenditure on consumer goods and services, which reached a level of $97.5 billion in the fourth quarter; because consumption grew faster than income, personal saving fell to 8.0 per cent of personal disposable income from 8.6 per cent in the third quarter. The largest increases in personal expenditure occurred in spending on durables and non-durables, which grew by 6.9 per cent and 5.5 per cent, respectively; the growth in durables was largely a result of strong demand for automobiles and a more moderate demand for household appliances (which no doubt reflects the large growth in residential construction in the last half of 1975), while the increase in non-durables was broadly based but was particularly strong in food. Expenditure on services[1] grew by 2.6 per cent, and on semi-durables, coming off a very strong third quarter, by 0.3 per cent. In real terms, total consumption increased by 1.7 per cent and the relative performance of the individual components was similar to the current dollar pattern; spending on semi-durables declined by 0.7 per cent, expenditure on services was unchanged, and durable and non-durable spending increases by 4.9 per cent and 3.2 per cent, respectively.

Fixed Capital Formation

Total gross fixed capital formation in the fourth quarter was $39.9 billion, an increase of 5.0 per cent from the third quarter level; in real terms, investment increased by 1.6 per cent. All of the real growth occurred in the business sector. By far the largest increase was in the extremely volatile residential construction component, which is recovering from a decline of over 25 per cent from its second quarter 1974 peak; the fourth quarter rise of 12.7 per cent, the third increase in a row, contributed about one third of the total growth in real final domestic demand and left residential construction only slightly below its previous high. Business real investment in plant and equipment fell by a marginal 1.1 per cent, roughly equal to the third quarter increase. Business non-residential investment grew by 4.4 per cent, while investment in machinery and equipment fell by 5.5 per cent, as both domestic shipments and imports declined.

Inventory Investment

Inventory liquidation increased in the fourth quarter, as the value of the physical change in inventories declined to -$2.7 billion from -$2.1 billion in the third; the major portion of the fourth quarter liquidation occurred in business non-farm inventories. Of this, $0.3 billion (that is, value of physical change of -$0.3 billion) came in retail trade and a further $1.5 billion in wholesale trade. The value of the physical change in manufacturing inventories was virtually zero following a large third quarter inventory liquidation, but within manufacturing, there was an accumulation of about $0.3 billion in non-durable inventories and a roughly equal decumulation in inventories of durable goods. Stock-to-shipments ratios declined in both retail trade, where the ratio is now below the historical average, and in wholesale trade, where it was more in line with the historical average; however, the stock-to-shipments ratio was still well above the historical average in manufacturing. In constant dollar terms, the value of physical change in the fourth quarter was -$1.8 billion compared with -$1.1 billion last quarter; again, most of this occurred in business non-farm inventories.

The External Sector

Total exports of goods and services grew in the fourth quarter by 3.4 per cent. The largest increase occurred in merchandise exports particularly in wheat, crude petroleum and natural gas. Decreases in imports of a large number of commodities were more than offset by increases in coal, textiles, chemicals and motor vehicles as total imports increased by 3.3 per cent; merchandise imports increased in real terms for the first time since the third quarter of 1974. Because imports increased more than exports, the balance of trade in goods and services worsened to a deficit of $5.7 billion at annual rates. An improvement on the goods account was offset by a deterioration of $0.7 billion in the services deficit.

The Government Sector

Government current expenditure on goods and services declined by 1.2 per cent, in part reflecting the payment of cost-of-living allowances in the third quarter. Total expenditures of all levels of government (excluding inter-government transfers) increased by a marginal 1.1 per cent, the smallest increase in several years. Total government revenues increased at about the same rate, and as a result the government deficit on a National Accounts basis was unchanged at approximately $5.1 billion at annual rates. Personal income tax collections declined, possibly as a result of the postal strike, while indirect taxes less subsidies grew by 5.6 per cent.

Prices decelerated slightly in the fourth quarter, as the implicit Gross National Expenditure price index slowed to a 2.5 per cent increase from 2.9 per cent in the previous quarter. The decline in the rate of change was even more noticeable in the final domestic demand implicit index – the price index most representative of the cost of goods and services purchased by Canadians – which increased by a moderate 1.5 per cent compared with 3.1 per cent in the third quarter, and the implicit indices for government current expenditure and imports of goods and services declined by 2.2 per cent and 1.0 per cent, respectively. The personal expenditure implicit index increased by 2.1 per cent, the largest increase occurring in services and the smallest, in semi-durables. The strong 12.7 per cent increase in real output in

(Continued on page 120)

---

[1] The weakness in spending on services largely reflected a deceleration in net expenditure abroad; excluding this component, expenditure on services increased by 3.0 per cent in the fourth quarter, compared with 3.0 per cent and 3.5 per cent in the second and third quarters.

OBSERVATIONS

REVISION OF THE LABOUR FORCE SURVEY

During the past three years, Statistics Canada has been developing a number of substantial modifications to the Labour Force Survey, the monthly household survey which is the source of the employment, unemployment and other labour force estimates published monthly by Statistics Canada. These changes have now been implemented and the data relating to January 1976 and thereafter will be based on the revised survey.[1] This note summarizes the background, nature and effect of the revisions, and provides comparisons of some of the more important data series. More detailed data and descriptions of the changes are available from the Labour Force Survey Division, Statistics Canada.

The main purpose of revising the survey has been to provide a much more comprehensive range of information on employment and unemployment in Canada. The Labour Force Survey was introduced in 1945, and has collected essentially the same information since that time. While the survey had continued to meet its basic objective of providing timely aggregate measures of labour market conditions, it has not been able to meet the growing information requirements of the far more complex economy of the present day and the years ahead. In order to meet the known requirements for new information, and to develop the survey capacity to meet other new requirements as they are expected to emerge in future, a major project to revise the LFS was begun late in 1972.

Following extensive consultation with data users throughout 1973 and early 1974 to determine exact data requirements and priorities, a revised questionnaire and associated survey materials and procedures were developed and introduced in a separate survey carried out in parallel with the former survey throughout 1975. The parallel operation was designed to provide a full year's data to enable analysis of differences between the surveys over all months of the year and to provide the basis for the adjustment of historical data to make them consistent with the new survey. Following the December survey, the old survey was discontinued and the revised survey became the source of the monthly labour force estimates.

Nature of revisions – In addition to a number of substantial enhancements of an operational or statistical nature,[2] there are two major aspects of the revisions which contribute significantly to the survey data:

(i) Collection of new data – In response to the identified data requirements, a wide range of new data on labour force activities and characteristics is now collected in the survey. The additional information is used to determine more precisely the labour force status (employed, unemployed or not in the labour force) of survey respondents, and to provide previously unavailable data of the composition and characteristics of these three groups.

In the area of employment, for example, new information is collected on such topics as usual and actual hours of work, overtime, time lost, reasons for time lost, multiple job-holding, duration of employment, absences from work and efforts made to find another job. For persons not at work, a large amount of new information is gathered on previous work history, including industry and occupation, duration of employment and main reason for leaving the last job held. With respect to job seeking activities the new survey collects such information as methods used to find work, duration of unemployment, activity prior to job search, the kind of work being sought (i.e., full-time or part-time, and whether to last more than or less than six months), and availability for work in the survey reference week. It also identifies persons on layoff and persons waiting to start a new job. For all persons covered by the survey additional information is obtained on family status and on educational levels and activities.

---

[1] In addition, a substantial amount of published historical data will be adjusted to be consistent with data produced by the revised survey. The method of deriving these revised historical statistics is briefly described at the conclusion of this note.

[2] Including a major revision of sample frame, the introduction of refinements in sampling techniques, the incorporation of updated population estimates for weighting the sample data, and substantial improvements in data collection, quality control and data processing methods.

(ii) More specific survey questions – The second aspect of the revisions having a significant impact on the survey data relates to the introduction of much more direct and specific questions on the monthly questionnaire. The former survey used two very general questions ("What did this person do mostly last week?" and "Did this person do anything else last week?") to identify labour force activities. Such indirect questions generally required further explanation on the part of the survey interviewer, who, on the basis of the response to these questions, was required to mark the questionnaire according to one of several general categories – "Worked", "Looked for work", "Went to school", "Kept house", etc.

The revised survey replaces the two general questions with a series of specific, direct questions designed to provide much more precise and comprehensive information about labour force activities and characteristics. The following questions taken from the questionnaire illustrate the more precise style of data collection: "Did . . . do any work at all last week, not counting work around the house?", "How many hours did . . . actually work last week?", "Last week, did . . . have a job at which he/she did not work?", "In the past six months has . . . looked for work?", "In the past four weeks what has . . . done to find work?", "Was there any reason why . . . could not take a job last week?".

Impact of revisions – In addition to providing a wide range of new labour market information, the revision of the survey has resulted in changes in the levels and patterns of certain existing data series.

(i) Changes in employment estimates – Comparison of the data collected during the parallel run of the two surveys in 1975 shows that the revised survey provides slightly higher estimates of employment. The level is slightly more than 2 per cent higher in terms of the annual average employment (see Table A), and is attributable to the more precise identification of employment activities in the revised survey. The use of direct questions results in more complete reporting of part-time employment and identifies more persons who had a job but were not at work during the survey reference week.

The increase in employment levels is concentrated among women of all age groups (+ 4.4 per cent) and men 15 to 24 (+ 2.8 per cent) – groups for which employment involving short hours is most common. The revised survey shows no change in employment for men 25 years of age and over. Higher female employment occurs in all provinces, with increases somewhat less than the national average in Newfoundland and Quebec, and above the average in Nova Scotia, Saskatchewan and Alberta. In the latter two provinces and to a lesser extent in Manitoba, increases in unpaid farm work by wives of farm operators account for a substantial proportion of the increase in the estimates of female employment.

(ii) Changes in unemployment estimates: As shown in Table A, the annual average unemployment rate in 1975 was 6.9 per cent based on the revised survey, compared with 7.0 per cent in the former survey. While this difference is very slight, there are, however, substantial differences in the estimates for men and for women, and in the data for the various provinces. In particular, the revised survey shows substantially higher unemployment levels for women, and a decrease in the level of unemployment among men.

The higher level of female unemployment (an annual rate of 8.1 compared to 6.4) is the result of the much better identification of job search activities among women in the revised survey. In the former survey, there was a tendency on the part of women not to report looking for work in response to the general questions "What did . . . do mostly last week?" and "Did . . . do anything else last week?". Rather, they tended to respond in terms of household or other non-labour force activities, which account for a much greater proportion of the time of many women. Hence while the old survey accurately indicated trends and changes in female unemployment, it understated the levels and rates. The difference in the revised survey data are consistent with the higher female unemployment levels indicated by the 1971 Census which used a more direct question about looking for work than did the former labour force survey.

The increase in female unemployment occurs in all provinces, with greater than average increases in Newfoundland, Manitoba and Alberta, and a less than the average increase in Quebec. No pronounced differences in seasonal patterns are shown, and higher levels occur in both the 15 to 24 and 25 and over age groups. In both age groups, the increases are greatest for married women.

In contrast to the higher estimates for women, unemployment levels and rates for men based on the revised survey are lower than the comparable estimates derived from the former survey. As shown in Table A, the revised 1975 annual average unemployment rate for men was 6.2 per cent, compared to 7.4 per cent in the old survey. Differences in the estimates are greatest during the winter months (see Table B), especially for men 15 to 24.

OBSERVATIONS

REVISION OF THE LABOUR FORCE SURVEY

During the past three years, Statistics Canada has been developing a number of substantial modifications to the Labour Force Survey, the monthly household survey which is the source of the employment, unemployment and other labour force estimates published monthly by Statistics Canada. These changes have now been implemented and the data relating to January 1976 and thereafter will be based on the revised survey.[1] This note summarizes the background, nature and effect of the revisions, and provides comparisons of some of the more important data series. More detailed data and descriptions of the changes are available from the Labour Force Survey Division, Statistics Canada.

The main purpose of revising the survey has been to provide a much more comprehensive range of information on employment and unemployment in Canada. The Labour Force Survey was introduced in 1945, and has collected essentially the same information since that time. While the survey had continued to meet its basic objective of providing timely aggregate measures of labour market conditions, it has not been able to meet the growing information requirements of the far more complex economy of the present day and the years ahead. In order to meet the known requirements for new information, and to develop the survey capacity to meet other new requirements as they are expected to emerge in future, a major project to revise the LFS was begun late in 1972.

Following extensive consultation with data users throughout 1973 and early 1974 to determine exact data requirements and priorities, a revised questionnaire and associated survey materials and procedures were developed and introduced in a separate survey carried out in parallel with the former survey throughout 1975. The parallel operation was designed to provide a full year's data to enable analysis of differences between the surveys over all months of the year and to provide the basis for the adjustment of historical data to make them consistent with the new survey. Following the December survey, the old survey was discontinued and the revised survey became the source of the monthly labour force estimates.

Nature of revisions – In addition to a number of substantial enhancements of an operational or statistical nature,[2] there are two major aspects of the revisions which contribute significantly to the survey data:

(i) Collection of new data – In response to the identified data requirements, a wide range of new data on labour force activities and characteristics is now collected in the survey. The additional information is used to determine more precisely the labour force status (employed, unemployed or not in the labour force) of survey respondents, and to provide previously unavailable data of the composition and characteristics of these three groups.

In the area of employment, for example, new information is collected on such topics as usual and actual hours of work, overtime, time lost, reasons for time lost, multiple job-holding, duration of employment, absences from work and efforts made to find another job. For persons not at work, a large amount of new information is gathered on previous work history, including industry and occupation, duration of employment and main reason for leaving the last job held. With respect to job seeking activities the new survey collects such information as methods used to find work, duration of unemployment, activity prior to job search, the kind of work being sought (i.e., full-time or part-time, and whether to last more than or less than six months), and availability for work in the survey reference week. It also identifies persons on layoff and persons waiting to start a new job. For all persons covered by the survey additional information is obtained on family status and on educational levels and activities.

[1] In addition, a substantial amount of published historical data will be adjusted to be consistent with data produced by the revised survey. The method of deriving these revised historical statistics is briefly described at the conclusion of this note.

[2] Including a major revision of sample frame, the introduction of refinements in sampling techniques, the incorporation of updated population estimates for weighting the sample data, and substantial improvements in data collection, quality control and data processing methods.

(ii) More specific survey questions – The second aspect of the revisions having a significant impact on the survey data relates to the introduction of much more direct and specific questions on the monthly questionnaire. The former survey used two very general questions ("What did this person do mostly last week?" and "Did this person do anything else last week?") to identify labour force activities. Such indirect questions generally required further explanation on the part of the survey interviewer, who, on the basis of the response to these questions, was required to mark the questionnaire according to one of several general categories – "Worked", "Looked for work", "Went to school", "Kept house", etc.

The revised survey replaces the two general questions with a series of specific, direct questions designed to provide much more precise and comprehensive information about labour force activities and characteristics. The following questions taken from the questionnaire illustrate the more precise style of data collection: "Did . . . do any work at all last week, not counting work around the house?", "How many hours did . . . actually work last week?", "Last week, did . . . have a job at which he/she did not work?", "In the past six months has . . . looked for work?", "In the past four weeks what has . . . done to find work?", "Was there any reason why . . . could not take a job last week?".

Impact of revisions – In addition to providing a wide range of new labour market information, the revision of the survey has resulted in changes in the levels and patterns of certain existing data series.

(i) Changes in employment estimates – Comparison of the data collected during the parallel run of the two surveys in 1975 shows that the revised survey provides slightly higher estimates of employment. The level is slightly more than 2 per cent higher in terms of the annual average employment (see Table A), and is attributable to the more precise identification of employment activities in the revised survey. The use of direct questions results in more complete reporting of part-time employment and identifies more persons who had a job but were not at work during the survey reference week.

The increase in employment levels is concentrated among women of all age groups (+ 4.4 per cent) and men 15 to 24 (+ 2.8 per cent) – groups for which employment involving short hours is most common. The revised survey shows no change in employment for men 25 years of age and over. Higher female employment occurs in all provinces, with increases somewhat less than the national average in Newfoundland and Quebec, and above the average in Nova Scotia, Saskatchewan and Alberta. In the latter two provinces and to a lesser extent in Manitoba, increases in unpaid farm work by wives of farm operators account for a substantial proportion of the increase in the estimates of female employment.

(ii) Changes in unemployment estimates: As shown in Table A, the annual average unemployment rate in 1975 was 6.9 per cent based on the revised survey, compared with 7.0 per cent in the former survey. While this difference is very slight, there are, however, substantial differences in the estimates for men and for women, and in the data for the various provinces. In particular, the revised survey shows substantially higher unemployment levels for women, and a decrease in the level of unemployment among men.

The higher level of female unemployment (an annual rate of 8.1 compared to 6.4) is the result of the much better identification of job search activities among women in the revised survey. In the former survey, there was a tendency on the part of women not to report looking for work in response to the general questions "What did . . . do mostly last week?" and "Did . . . do anything else last week?". Rather, they tended to respond in terms of household or other non-labour force activities, which account for a much greater proportion of the time of many women. Hence while the old survey accurately indicated trends and changes in female unemployment, it understated the levels and rates. The difference in the revised survey data are consistent with the higher female unemployment levels indicated by the 1971 Census which used a more direct question about looking for work than did the former labour force survey.

The increase in female unemployment occurs in all provinces, with greater than average increases in Newfoundland, Manitoba and Alberta, and a less than the average increase in Quebec. No pronounced differences in seasonal patterns are shown, and higher levels occur in both the 15 to 24 and 25 and over age groups. In both age groups, the increases are greatest for married women.

In contrast to the higher estimates for women, unemployment levels and rates for men based on the revised survey are lower than the comparable estimates derived from the former survey. As shown in Table A, the revised 1975 annual average unemployment rate for men was 6.2 per cent, compared to 7.4 per cent in the old survey. Differences in the estimates are greatest during the winter months (see Table B), especially for men 15 to 24.

[1] The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2] Includes logging, fishing, trapping and hunting. [3] Includes mechanical and construction. [4] Includes a small number in non-specified occupations. [5] Does not include students entering Canada on students' visas. [6] Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. **Source: Quarterly Bulletin, Department of Manpower and Immigration.**

---

[1] Excludes profits (net of losses) of government business enterprises. [2] Includes the withholding tax applicable to this item. [3] Includes profits (net of losses) of govemment business enterprises and interest ant miscellaneous investment income of government. [4] Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5] Includes net income of independent professional practitioners. [6] See footnote 4, Table 1.2. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

---

[1] Includes defence expenditures. [2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4] The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1). [5] See footnote 4, Table 1.1. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1]The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars y the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are fected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter ovements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of ice change. **Source: National Income and Expenditure Accounts (13-001), Statistics Canada.**

[1] Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are reated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of he treatment of insurance. [2] Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3] Withholding taxes. The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have een generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series. **For source ee Table 1.9.**

---

[1]These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and tween major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar mparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change. **For source see Table 1.9.**

---

[1] The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). [2] The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

---

[1] A vacancy rate is obtained by expressing the number of vacancies per thousand existing jobs (sum of vacant and filled jobs) in all industries, except iculture, fishing and trapping, domestic service and the non-civilian component of public administration and defence. Both full-time and part-time jobs are luded. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the l sample was reduced. These est. should be used with caution due to their reduced reliability. **Source: Quarterly Report on Job Vacancies (71-002), Statistics ıada.**

[1] In calculating time lost, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as e laid off as a result of a work stoppage, is not included. [2] The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. n January 1973 forward, the 1970 S. I. C. is used. [3] The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. [4] The statistics for individual industries ude strikes and lockouts involving fewer than 100 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. In tion, the total is revised quarterly whereas the individual categories are revised annually. [5] Includes miscellaneous manufacturing industries. [6] Includes ishing and allied industries. [7] Includes storage and communication industries. **Source: Research Bulletin, Labour Canada.**

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the ı. Greater industrial and area detail and more explanatory notes are given in the source publication named below. The Industrial Composite is the sum of all tries except agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households and c administration and defence. **Source: Employment Earnings and Hours (72-002), Statistics Canada.**

[1] See footnote 1 and source in Table 10. [2] Employment indexes in total manufacturing and in its total durable and non-durable components are given in Tabl 9. In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non durable manufacturing. [4] Except machinery and transportation equipment industries.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the th. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2] In addition to those listed, tobacco products; ting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. **Source: Employment Earnings Hours (72-002), Statistics Canada.**

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term ntracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. [2] Total new orders received during the period estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3] Total nufacturing inventory owned by manufacturers including warehouse stocks. **Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), tistics Canada.**

[1] Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2] Intended or cigarettes. [3] Prior to March 1973 included smoking, chewing and twist. From March 1973 on, includes tobacco intended for pipe smoking only. [4] Includes sales to holesalers or retailers. [5] Subject to Excise Tax. [6] Includes sales for ships' stores and for export. [7] End of period. **Sources: Tobacco and Tobacco Products tatistics Quarterly (32-014), Production and Disposition of Tobacco Products Monthly (32-022), Statistics Canada; and Department of National Revenue.**

---

[1] Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to semi finished and rolled steels products y. Shipments to consuming industries of castings, forgings and steel pipe are not included. [2] Includes building contractors, public and utility construction, ictural steel fabricators, national defence and public works and utilities. [3] Includes appliances and utensils. [4] Excluding shipments for re-processing at cer's own plant. **Source: Primary Iron and Steel (41-001), Statistics Canada.**

---

[1] Production plus imports less re-exports, minus exports. [2] Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. **Sources: Motor Vehicle Shipments** (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

---

[1] Barrels of 35 Canadian gallons. [2] Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3] Refinery production from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4] Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5] Includes inventories at end of period being held at gas plants and in storage caverns. [6] Includes stove oil, kerosene. [7] Includes aviation gasoline and aviation turbo fuel. [8] Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9] Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products. **Source: Refined Petroleum Products (45-004), Statistics Canada.**

[1] A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan [illegible] centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. T remainder of the country is covered on a sample basis quarterly. **Source: Housing Starts and Completions (64-002), Statistics Canada.**

Note: Components may not add to totals due to rounding. [1] The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when th r current annual totals for all firms are known the following year. [2] Excluding trucks. [3] The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. **Source: Farm Implement and Equipment Sales (63-009), Statistics Canada.**

[1] Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as nging quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of m with price indexes of output can yield misleading indications of the changing relationship of costs and imcome. [2] 1973 and 1974 price indexes are subject to ision. [3] 1974 price indexes are subject to revision. [4] Farm share only of motor vehicles. [5] In addition to the components listed, the major group includes lding Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6] In addition to components listed, the major group includes Seed, Custom k, Artificial Insemination, Small Tools and Supplies, and Electricity.

---

[1] Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2] Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3] Includes baking and frying oils and fats. [4] Includes stocks held by manufacturers and other warehouses. [5] Includes fresh sausage, frankfurters, weiners and all other sausage. [6] Includes solid, coated, bulk, packages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. **Sources: Grain Milling Statistics (32-003), Oils and Fats (32-006),** Quarterly Reports, **Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017) and Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001),** Monthly Report, **Meat and Meat Preparations, Statistics Canada.**

Note: Components may not add to totals because of rounding.

[1] Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities. Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit. [2] Conditional sales agreements held by sales finance companies and by consumer lo companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. [3] Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [4] Personal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5] Includes bank-sponsored credit card balances. [6] The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present: this series is repeated in the unadjusted form. [7] Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. [8] Bills due for non-commercial use of telephones, gas and electric power. [9] Personal cash loans only. The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form. **Sources: Consumer** Credit (61-004), Statistics Canada; Bank of Canada; and Department of Insurance.

[1] Column numbers refer to tables 3 and 4 section 11. [2] Includes special transaction-trade, not shown separately. [3] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [4] Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. **Source: Trade of Canada, Exports (65-004), Statistics Canada.**

[1] Column numbers refer to tables 3 and 4, section 11. [2] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3] Includes special transaction-trade, not shown separately. [4] Includes scrap. [5] Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports (65-007), Statistics Canada.**

[1] Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regi airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the tot revenues and expenses reported by Canadian commercial air carriers. [2] Cargo includes air freight and express but excludes mail and excess baggage. **Sources: A Carrier Operations in Canada (51-002) Statistics Canada Air Carrier Financial Statements (51-206) Statistics Canada Aviation Statistics Centre (51-004) Statisti Canada.**

[1]Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2]Daily averages for period. [3]Mainly deposits of foreign banks. [4]Capital, rest fund and undivided profits as at the latest fiscal year-end. [5]Including issues payable in foreign currency. [6]Excluding Canadian day-to-day loans. [7] Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8] Loans to grain dealers and exporters. [9]Loans to finance purchase of Canada Savings Bonds at time of issue. [10]Including loans to instalment finance companies. [11]These series reflect the combination of two CANSIM series. **Source: Bank of Canada Review.**

NOTE: Components may not add to totals because rounding. [1] This series was designed to cover 50 clearing house centres. With the advent of centralized ata processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; owever, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined. Seasonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted. **Source: Cheques Cashed in Clearing Centres (61-001), Statistics Canada.**

[1] Excluding revivals, increases, dividend additions, reinsurance acquired, credit insurance and pension bonds without insurance. Value totals are estimates projected from the sales reported by companies operating in Canada representing over 80% of new ordinary and of new group contracts. [2] Total new settled-for ordinary sales in Canada. [3] Total sales figure does not include sales for Northwest Territories. [4] Under new or amended contracts. **Source: Monthly Survey of Life Insurance Sales in Canada, Life Insurance Agency Management Association, Hartford, Connecticut, U. S. A.**

---

[1] The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. [2] The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3] Combines the industrials, utilities and finance common stocks. [4] Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5] Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. [6] Stocks included in the mining index are for producing mines. **Source: Prices** and Price Indexes (62-002), Statistics Canada.

---

[1] This statement includes only receipts relating to budgetary revenue. Excluded are non-budgetary revenues such as Old Age Security Fund taxes, Prairie Farm Assistance Act levies, employer and employee contributions to government-held funds (Unemployment Insurance, Superannuation etc.), interest on government-held funds, and taxes collected on behalf of and transferred to other governments. [2] Beginning in December 1973, this category includes oil export tax. [3] March includes supplementary payments arising from the closing of the accounts. **Sources: The Canada Gazette and Dept. of Finance.**

SOURCE: FINANCIAL FLOW ACCOUNT (13-002), STATISTICS CANADA.

(Continued from page 7)

residential construction in the fourth quarter was accompanied by a mild quarterly rate increase in prices of 0.4 per cent.

Gross National Product – Annual 1975

Gross National Product in 1975 was $154.8 billion, an increase of 9.9 per cent from the level of the previous year; however, this growth includes an increase in prices of over 9.5 per cent. The recession that began in 1974 bottomed out early in 1975, but because the subsequent recovery proved to be relatively weak, the total level of real output in the economy increased by a mere 0.2 per cent. The performances of individual expenditure aggregates reflected the basic recessionary character of the year: investment in residential construction and exports of goods and services both declined in real terms in 1975, there was a dramatic swing in inventories of more than $2.8 billion, and personal expenditure on consumer goods and services recorded its smallest real growth since 1970. There was a modest increase in the current dollar value of exports, but this was outweighed by a substantial increase in imports, and the balance of trade in goods and services worsened by $3.3 billion. The slight increase in real Gross National Expenditure was accompanied by a significant deceleration in prices, but the overall Gross National Expenditure implicit price index nevertheless increased by 9.7 per cent.

Consumer Outlays

Current dollar expenditure on consumer goods and services grew by 14.8 per cent in 1975, but this represents an increase of only 3.7 per cent in real terms. For the year, the largest real increase in both absolute and percentage terms was in expenditure on semi-durable goods, which grew by 7.3 per cent; this increase was accompanied by a relatively modest price increase of 5.9 per cent. Expenditure on durables was also fairly strong, growing by 14.8 per cent in current dollars and 5.7 per cent in real terms, as spending on new and used automobiles grew by 20.6 per cent. Spending on services and non-durable goods increased by 14.7 per cent and 15.6 per cent, respectively, in current dollars, but by only 2.2 per cent and 2.8 per cent in real terms; there were large price increases during the year in both of these expenditure categories.

Fixed Capital Formation

Total gross fixed capital formation grew to $37.3 billion, an increase of 13.5 per cent; this is a considerable slowdown from the increases of the previous two years, and, in real terms, capital formation grew by only 1.6 per cent. The weakness was concentrated in residential construction which declined by 10.7 per cent in real terms as a result of a precipitous drop in housing starts in late 1974 and early 1975. There was a significant shift in the composition of residential construction during the year, as starts of duplexes and row housing increased by 40 per cent, while single detached housing starts rose by only 1.5 per cent and apartments starts declined by 4.9 per cent. Business investment in plant and equipment grew by 4.7 per cent in constant dollars, as non-residential construction increased by 7.4 per cent and investment in machinery and equipment, by 2.5 per cent; within non-residential construction, the increase was stronger in engineering (that is, construction of highways, pipelines, utilities, etc.) than in building construction.

Inventory Investment

Investment in inventories swung from an accumulation of $2.7 billion in 1974 to a decumulation of $0.8 billion in 1975, all of which took place in business non-farm inventories. There was strong liquidation in both manufacturing and wholesale trade after accumulations in 1974, and in both sectors, the run-down was largely in durable goods. Retail trade was virtually flat for the year (close to zero value of physical change) after an accumulation of approximately $0.2 billion in 1974.

The External Sector

The external sector was one of the major sources of weakness in 1975. Exports rose 3.0 per cent while imports were up 11.0 per cent, resulting in a $3.3 billion deterioration in the trade balance to a record deficit of $5.5 billion. The traditional deficit on service transactions worsened by $1.0 billion, but the swing in merchandise trade from a surplus of $1.5 billion in 1974 to a deficit of $0.8 billion accounted for about 70 per cent of the overall swing in the trade balance. The increase in exports was due to a very large increase in natural gas exports, together with substantial increases in iron ore, coal, agricultural and industrial machinery, and motor vehicles and parts, while the rise in imports was accounted for by increases in energy goods, most notably petroleum, and by strong increases in machinery and equipment and motor vehicles and parts. On the service account, the deterioration resulted from a larger travel deficit and higher interest and dividend payments abroad.

Government Sector

Total revenue of all levels of government (excluding intergovernment transfers) rose by 7.7 per cent in 1975, the lowest rate of increase in several years. All major tax categories showed considerably lower rates of growth than in 1974, which reflects both lower tax rates and the slowdown in business activity. On the other hand, total government expenditures continued the strong growth of the previous year, although at a slightly lower rate, and increased by 20.0 per cent. Outlays on goods and services rose by about 16 per cent, as wage and salary payments, which account for over 50 per cent of total government expenditure on goods and services, increased by about 18 per cent. Transfer payments to persons grew by 23 per cent with higher unemployment benefits an important factor in the increase. Thus, with expenditure rising more rapidly than revenues, the government sector as a whole registered a deficit, on a National Accounts basis, of $4.6 billion in 1975, the first large deficit since the early sixties.

Incomes

Labour income rose by 14.0 per cent in 1975, compared with an increase of 16.9 per cent in 1974. A major factor in the lower rate of growth was the effect of larger lay-offs and more man-days lost in industrial disputes. There were only marginal increases in employment during 1975, and most of the increase in labour income reflected higher average earnings. Wages and salaries in the goods-producing industries increased by 10.0 per cent compared with 14.0 per cent in 1974, as the industries in this group were particularly affected by strikes and layoffs. Wages and salaries in the service-producing industries rose by 16.3 per cent after a 17.7 per cent increase the year before, with a slower rate of employment growth the major reason for the deceleration.

Corporation profits before taxes fell by 2.9 per cent in 1975, the first decline since 1970 and only the second in fifteen years. It follows four years of substantial increases. Profits in both mining and manufacturing decreased, while profits in trade were virtually unchanged and finance profits increased substantially.

Accrued net income of farm operators was unchanged over the year, with an 8 per cent increase in gross income being offset by higher operating costs. The value of grain production was up by about 10 per cent, due mainly to larger crop production, but the value of livestock production declined marginally. Net income of non-farm unincorporated business was up 9 per cent year over year, the largest increases occurring in retail trade, and community and personal services.

The shares of Gross National Product held by labour income and profits followed their normal cyclical patterns and reflected the marginal increase in real output in 1975, as labour's share rose to 56.0 per cent from 53.9 the year before, and profits' share fell to 11.5 per cent from 13.0 per cent. Farm income's share of Gross National Product fell slightly, while that of non-farm unincorporated business was unchanged.

Some price deceleration was evident in 1975, as the Gross National Expenditure implicit price index increased by 9.7 per cent compared with 13.8 per cent in 1974, and the increase in the final domestic demand index fell to 10.9 per cent from 11.9 per cent the year before. However, the indices for personal expenditure and gross fixed capital formation both showed larger increases than the Gross National Expenditure index because of the influence of import prices, which were up by 13.9 per cent. The implicit price indices for personal expenditure on services and non-durable goods both increased at relatively high rates, growing by 12.2 per cent and 12.4 per cent, respectively, while durables and semi-durables rose at more moderate 8.5 per cent and 5.9 per cent rates. Overall, the implicit price index for personal expenditure increased by 10.7 per cent. The index for total fixed capital formation grew by 11.7 per cent; the rate of change of prices declined in both the public and private sectors for every major class of construction.

TABLE 1. National Income and Gross National Product, by Quarters, 1974 and 1975

Seasonally adjusted at annual rates

	1974					1975				
	I	II	III	IV	Year	I	II	III	IV	Year
	millions of dollars									
Wages, salaries, and supplementary labour income	71,220	73,584	77,948	81,128	75,970	82,540	84,952	88,780	90,228	86,625

Gross National Product at market prices	**134,340**	**138,592**	**144,444**	**146,144**	**140,880**	**148,052**	**151,504**	**157,508**	**161,944**	**154,752**
Gross National Product at market prices excluding accrued net income of farm operators	**131,000**	**134,648**	**140,720**	**142,216**	**137,146**	**144,392**	**147,648**	**153,368**	**158,656**	**151,016**

[1] Excludes profits of government business enterprises.

[2] Includes the withholding tax applicable to this item.

[3] Includes profits (net of losses) of government business enterprises and other government investment income.

[4] Includes an arbitrary smoothing of crop production, and standard seasonal adjustment for withdrawals of grain from farm stocks and for the changes in farm-held livestock and other inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures of accrued net income of farm operators.

[5] Includes net income of independent professional practitioners.

[6] See footnote 4, Table 2.

TABLE 2. Gross National Expenditure, by Quarters, 1974 and 1975

Seasonally adjusted at annual rates

	1974					1975

Residual error of estimate	32	20	288	572	218	688	180	120	56	171
Gross National Expenditure at market prices	**134,340**	**138,592**	**144,444**	**146,144**	**140,880**	**148,052**	**151,504**	**157,508**	**161,944**	**154,752**
Final domestic demand	132,400	137,928	143,552	146,856	140,184	151,796	156,560	165,044	170,208	160,902
Detail of farm inventories and grain in commercial channels:										
Value of crop production and depletions of farm stocks of grain	676	- 652	96	164	- 397	600	672	- 596	- 724	- 12
Change in other farm-held inventories	- 40	308	532	160	240	364	64	- 92	- 176	40
Grain in commercial channels	76	356	372	144	127	- 48	624	512	296	34

[1] Includes defence expenditures. Details are shown in line 45, Table 16 of the forthcoming publication *National Income and Expenditure Accounts*, Catalogue 13-001.

[2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure.

[3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings.

[4] The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. (See line 8, Table 1.)

[5] In the seasonally adjusted series, the value of grain crop production in each quarter is taken as one fourth of the estimated value of crop production for the year as a whole (see footnote 4, Table 1). All other items in the farm inventories series are seasonally adjusted by standard techniques.

TABLE 3. Gross National Expenditure in Constant (1971) Dollars, by Quarters, 1974 and 1975

Seasonally adjusted at annual rates

	1974					1975

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

(Continued from page 9)

The lower unemployment estimates for men result mainly from differences in the manner in which the revised survey identifies, and subsequently classifies, persons who have not actively looked for work. The revised survey uses a series of specific questions[3] to identify persons who are looking for work and are available for work during the survey reference week. Anyone without work who has carried out any job search activities at all during the previous four weeks, and who is available in reference week for the work he is seeking, is classified as unemployed. In addition, persons on layoff for less than six months, or who have a new job to begin within four weeks of the reference week, are classified as unemployed whether or not they have actively looked for work during the past four weeks, provided they are available for work during the reference week. In the former survey, as noted earlier only two general questions were used to determine labour force status – "What did this person do mostly last week?" and "Did this person do anything else last week?". Persons were classified as unemployed if in response to these questions, they reported that they actively looked for work during the reference week, or would have actively looked for work except for their own temporary illness, indefinite layoff (i.e., did not actively look for another job because they expected to be called back to their old job) or the belief that no work was available (i.e., they reported that they would have looked except for their belief that no work was available).

Since no information on job search activities or availability for work was collected in the former survey, and with only very limited information on layoffs and persons with jobs to start in the future, direct comparisons of these components of the unemployment estimates are not possible. However, the comparisons which can be made indicate that in the former survey, particularly during the winter months, substantial numbers of men who were not actively seeking work were being reported as "looking for work" and therefore included in the unemployment estimates, while in the revised survey, such persons would be shown as not in the labour force. Because the revised survey was designed to collect new information on persons not in the labour force, particularly on their work history (including data on industry, occupation, duration of employment and reason for leaving last job) and job search activities over an extended period, it will be possible over time to develop much more comprehensive information about the characteristics and labour force activities of persons whose attachment to the labour force may change frequently.

(iii) New data – In addition to using its wider range of information for purposes of determining labour force status, the revised survey provides a much more comprehensive range of information describing the composition and characteristics of the employed, unemployed and non-labour force categories. Some of this new data (e.g., information on multiple job holding, layoffs, persons with jobs to start in the future) was published in the *January Release* (Statistics Canada, Catalogue 71-001P). Other new information will be added to the Monthly Bulletin as the data series are developed in the months ahead. The revised survey also will facilitate the development of important new measures relating to the flows or movements between the various labour force categories, information which is of considerable value in analysing the changes in levels shown by the survey each month.

(iv) More detailed data – As the final major step in the revision of the survey, an increase in the sample size (from approximately 32,000 to 55,000 households) is planned for late 1976 to enable the provision of more detailed and more accurate estimates, especially for provincial data. In Prince Edward Island, the sample size is being expanded at the present time, which should enable estimates of unemployment and unemployment rates to be published for the first time following the April survey.

Historical Statistics

As mentioned previously, the old and new surveys were run in parallel through the 12 months of 1975. The data from this operation have been used to derive ratios expressing the relative levels of certain employment and unemployment estimates from the two surveys for each month of the year. These ratios were applied to the estimates from the former survey for the period 1970 to 1974. The result is an historically consistent time series which for the 1970 to 1975 period estimates what the data would have been at that time had the revised survey been in operation. This historically revised time series (or linked data) coupled with the revised survey data for 1975 and beyond can be used for time series analysis and seasonal adjustment.

The main labour force time series, that is, employment, unemployment, labour force, unemployment and participation rates have already been revised. These series are available by age (15 - 24, 25 and over) and sex at the Canada level but generally only as totals at the provincial level. While it will not be possible to historically revise all of the time series previously published from the former survey, Statistics Canada will continue to examine the results of the parallel run to determine which series can be linked to the revised survey estimates.

---

[3] The main questions in this series being "In the past six months has . . . looked for work?", "In the past four weeks what has . . . done to find work?", "About how many hours of work per week has . . . been looking for?", "Was there any reason why . . . could not take a job last week?".

TABLE A. Comparison of Selected Labour Force Characteristics – Former and New Surveys

Annual Averages, 1975

	Employed			Unemployed			Unemployment rate		
	Former survey	New survey	Difference	Former survey	New survey	Difference	Former survey	New survey	Difference

British Columbia	997	1,009	+ 12	91	94	+ 3	8.4	8.5	+ 0.1

Note: All data is based on 1971 Census population projections and includes persons 15 years of age and over.

TABLE B. Comparison of 1975 Monthly Unemployment Rates, Canada – Actual Data Former and New Surveys

	Total			Male			Female		
	Former survey	New survey	Difference	Former survey	New survey	Difference	Former survey	New survey	Difference
January	8.4	7.9	- 0.5	9.4	7.6	- 1.8	6.5	8.4	+ 1.9
February	8.6	7.7	- 0.9	9.7	7.3	- 2.4	6.6	8.3	+ 1.7
March	8.5	7.6	- 0.9	9.5	7.4	- 2.1	6.9	8.1	+ 1.2
April	8.1	7.2	- 0.9	9.0	6.9	- 2.1	6.3	7.8	+ 1.5
May	7.0	6.8	- 0.2	7.6	6.1	- 1.5	6.0	8.0	+ 2.0
June	6.8	6.6	- 0.2	6.8	5.8	- 1.0	6.7	8.2	+ 1.5
July	6.2	6.7	+ 0.5	6.1	5.7	- 0.4	6.4	8.5	+ 2.1
August	6.0	6.6	+ 0.6	5.7	5.5	- 0.2	6.4	8.6	+ 2.2
September	5.9	6.2	+ 0.3	5.6	5.3	- 0.3	6.4	7.7	+ 1.3
October	5.8	6.3	+ 0.5	5.6	5.3	- 0.3	6.1	8.1	+ 2.0
November	6.4	6.8	+ 0.4	6.3	5.8	- 0.5	6.6	8.4	+ 1.8
December	7.0	6.9	- 0.1	7.7	6.5	- 1.2	5.8	7.5	+ 1.7

Note: All data is based on 1971 Census population projections and includes persons 15 years of age and over.

It should be noted that since the seasonal adjustment process requires several years of monthly data as input, only those time series which can be historically revised will be seasonally adjusted.

As for the wealth of new information generated by the revised surveys, most data will be available only from January 1975 onwards with seasonal adjustment commencing as soon as enough monthly observations have been obtained.

Additional Information

The Labour Force Survey Division of Statistics Canada would be pleased to provide additional information relating to the revision of the survey. Simply write to the Director, Mr. D.B. Petrie or phone (613) 996-3990.

CHANGES IN WORKING LIFE OF CANADIAN MALES

K.S. Gnanasekaran*

The term "working life" refers to the average number of years of life that a person may spend in the labour force. The duration of length of working life in conjunction with the total years of life reveals the average number of years spent outside the labour force or in "dependence". Both measures, the number of years spent in productive life or in dependence, bear important implications for the individual, the family and the nation as a whole, and in consequence, are considered valuable indicators of social and economic conditions within a country. Working life may be regarded as a good indicator of the economic-demographic situation in a country in the sense that it reflects the potential contribution of a person to the national economy. In contrast, dependency life serves as a useful indicator of a given socio-demographic situation in that it has a close bearing on the nation's social cost for education, child-care, care of the disabled, and the provision made for elderly persons during their retirement. Actuaries, economists and demographers have long been drawn toward the importance of the length and pattern of working life and in recent years, the length and pattern of dependency life, particularly of retirement, have taken on a new importance in the industrialized low-mortality countries.

Direct information on working life, however, is rarely collected. Consequently, working life is measured indirectly through the construction of working life tables. Tables of working life, in addition to providing measures of the length and pattern of working life, also yield valuable information related to labour force dynamics, that is, the rates of entry into and withdrawal from the labour force due to death or retirement.

Efforts to construct working life tables for Canada based upon the results of the 1961 Census, were first attempted by Frank Denton and Sylvia Ostry.[1] Closely following their efforts, the present paper attempts to examine briefly the recent changes in working life and to compare patterns of working life that have emerged over the intercensal period 1961 - 71,[2] as published recently in *Working Life Tables for Males in Canada and Provinces, 1971*, by K.S. Gnanasekaran and G. Montigny. At a given time, the working life and its pattern are the result of the combined influences of mortality and labour force behaviour. Without going into great detail, it may be useful to summarize briefly the developments in these two variables over the past decades with a view to providing a background for the study of changes in working life of males in Canada.

For many years, Canada has experienced a low mortality of less than 10 deaths per 1,000 population.[2] Thus, as early as the expectation of life at birth was approximately 60 years for males as shown by Table 1 and 62 years for females.[3] Further reduction in mortality continued and the current expectation of life at birth averages about 69 years for males and 76 years for females,[4] that is, an increase of nine and fourteen years respectively in four decades. A significant aspect of this historical trend is that the bulk of the increase had occurred between 1931 and 1956, averaging an increase of 0.3 years per annum for males and 0.4 years for females. The improvement though not halted in later decades, did, however, relent considerably in the period 1956 - 71.

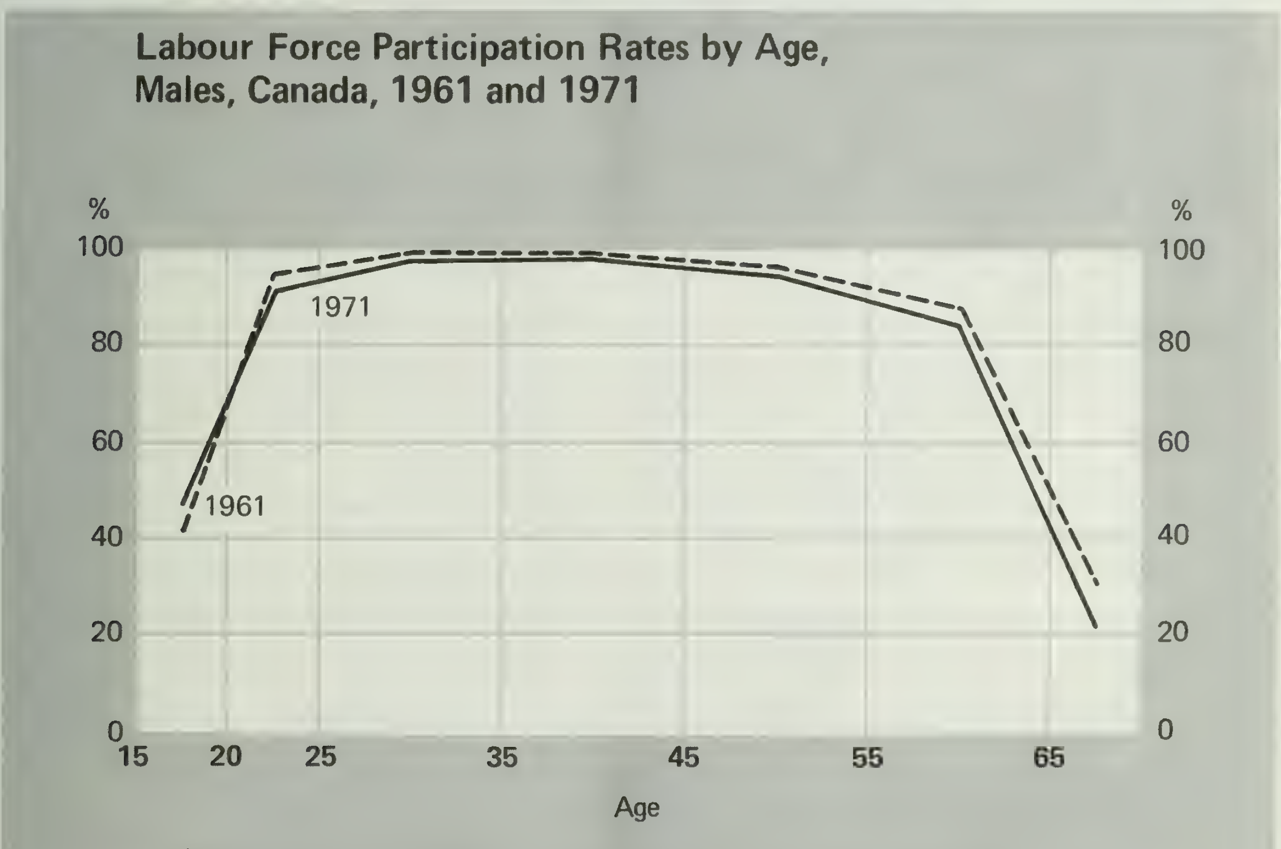
Chart 1



Source: K.S. Gnanasekaran, "The Labour Force", in C.I.C.R.E.D., The Population of Canada (Ottawa: Statistics Canada, 1974), p. 100.

With respect to labour force trends, the participation rates of men have been steadily declining in most age groups since 1921 as shown in Chart 1. Males in the young age groups appear to continue their education in larger numbers than did their brothers 10 years ago. The rising levels of family income and the greater number of scholarships and/or loans available are among the factors which now enable students to continue their higher education. The downtrend in labour force participation among the older males was particularly pronounced.[5]

Changes in Working Life

Against the background of the foregoing trends in mortality and male labour force participation, Table 1 presents the changes in the working life of males in Canada since 1931. In comparing these trends, it should be kept in mind that the estimates, particularly those for the earlier periods when the concept followed was not of the labour force but one of the gainful worker, may be relatively poor and, notwithstanding the adjustments made, may still suffer from errors due to qualitative differences in concepts.

During the period 1931 - 71, the length of working life changed considerably; at the beginning of this period, that is, in 1931, a man of 15 years could, on the average, expect to live another 53.4 years of which 48.0 years might be spent in the labour force and the remaining 5.4 years, outside the work force. By 1971, the life expectancy at age 15 had gone up by 2.9 years to 56.3 while the working life had declined to 47.3 years, thus leaving an average of 9.0 years spent outside the labour force. It should be stressed here, at the risk of repetition, that these figures are averages and a young person may never enter the labour force at all owing to disability or any other reasons and, in consequence, he may spend all his lifetime outside the labour force. Or, a person may die while employed and thus spend no time in retirement. Considering the recent decade 1961 - 71 which witnessed, on the one hand, a rapid decline in the participation rates of young men and, on the other, a rise in accident mortality occurring at the young ages, it may seem that the average life expectancy remained more or less the same in this period (see Table 1), while the working life declined from 48.0 years in 1961 to 47.3 years in 1971, thereby increasing the average number of years spent in retirement.

An examination of recent changes shows that the expectation of total life for males at age 15 was 56.3 years in 1971 as compared to 55.4 years in 1951, implying a slight increase of 0.9 years. For the same period, the expectation of working life declined for Canadian males from 47.9 years in 1951 to 47.3 years or by 0.6 years. This trend may be attributed to causes other than death. Indeed, had other factors remained unchanged, the expectation of working life would average about 49.0 years in 1971 indicating an increase of approximately one year owing to the mortality reductions that took place during these two decades.

This decline in working life expectancy became apparent in 1971. The downtrend, in fact, began after 1951. Thus, from 1951 to 1961, while the expectation of life increased by almost 0.8 years, the increase in work life expectancy was far less, about 0.1 year. This may be ascribed to the opposite trend in the labour force participation of men, a trend which has been consistently downward due to the increased enrolment of the young in higher education and to the lower rate of participation of the old in the labour force. Consequently, during 1961 - 71, when the mortality rates showed little improvement from ages 15 onwards, the negative impact of the changes in participation rate outweighed any positive influence of mortality thereby causing a decline in the working life expectancy. The labour force effect *per se* turns out at approximately minus 0.9 years in 1951 - 61 and minus 0.7 years in 1961 - 71 as shown in Table 2.

Looking ahead 15 years into the future, the length of working life may be expected to lie between 47.7 and 46.8 years. If the 1971 labour force participation rates continue unchanged and mortality declines, although at a lesser pace as the available projections imply, it is anticipated that the working life will increase from 47.3 years to 47.7 years or about one-half a year during the next 15 years. At the same time, it appears that the total life expectancy at age 15 will increase very slightly to 56.5 years and consequently, the retirement period will shrink to 8.8 years. However, it is very unlikely that the pattern of economic activity will remain constant over this and the next decade. Past trends in participation rates have clearly shown a consistent downtrend in most ages although the extent of decline varied from one age to another. In general, the young and the old exhibited marked changes while the rates for the ages 30 to 54 dropped slightly. This declining pattern was also noticed during the recent decade 1961 - 71, and for the purpose of projections, it is assumed that the historical downtrend will continue in the future, but that the pace will slow down to one-half the decline experienced during 1961 - 71. Under this assumption, the decline will still be considerable, from 7 per cent to 15 per cent in 15 years in the ages 65 to 69 and from 3 per cent to 5 per cent in the ages 55 to 59. In the ages 20 to 54, the total decrease will be slight or less than 3 per cent in the 15 years from 1971 to 1986. For the ages below 20, it is assumed that the present participation level will continue unchanged through 1986. Using these projected participation rates and projected life tables for 1986,[6]

the length of working life is anticipated to be 46.8 years in 1986. This implies a continuation of the downtrend observed in recent years (i.e., 1961 - 71) and a further decline of half a year in the length of working life between 1971 and 1986. In terms of components, the effect of future mortality may be seen to raise the working life by 0.4 years (i.e., from 47.3 to 47.7), but this will be more than offset by the negative effect of future trends in labour force participation which, as calculated in Table 2, will reduce the working life by 0.9 years (i.e., from 47.7 to 46.8). This decrease may mean earlier retirement in the future, and an increase in the average length of retirement life from 9.0 years in 1971 to 9.7 years by 1986 (see Chart 2).

Trend in Accession Pattern

Over the years, the pattern of labour force accession has changed markedly as is evident from Chart 2. In the 1930's, the rate of entry among males 14 to 16 years of age was relatively high. This pattern shifted in favour of higher ages in the following decades, resulting in a rise in the average age at entry into the labour force. Thus, the average age at entry into the labour force was 16.2 years in 1931 in contrast to 18.6 years in 1961. The pattern of accession in 1971 differed considerably from the patterns in the 1950's and 1960's reflecting a peak accession rate at age 17 and a mean age of entry into the labour force of about 19.2 years.

Several factors are responsible for the uptrend in the average age at labour force entry. The foremost among them being increased school attendance. The new entrants are now more qualified in terms of skills and educational attainment. Changes in the labour market resulting from industrialization and modernization can be another reason.

Trend in Separation Pattern

Another great value of the working life table lies in the information it provides on the pattern of labour force separations. The annual rates of separation which are shown in Chart 3 reflect the pattern of mortality changes in this country, especially those occurring at the older ages and the trend in recent decades toward a lower age of retirement.

Rates of withdrawal due to death follow a regular pattern consistent with the mortality curve. This pattern represents a steady rise in separation rates with advancing age. Over the period under review, the rates have declined slightly at every age. Until the age of 54, mortality is the more important factor, accounting for approximately two out of three withdrawals from the labour force. From age 55, however, causes other than mortality, are responsible for a large proportion of losses from the work force. This becomes particularly pronounced in the age group 60 - 64 with an annual retirement rate of 96.4 per 1,000 in 1971, compared to a loss of 22.8 per 1,000 resulting from mortality. Comparison of these separation rates over the period 1931 - 71 reveals striking developments bearing great implications for society. In 1931, the annual retirement rate was 30.6 per 1,000. This rate has since more than doubled to 69.5 in 1961, and, in the last 10 years, increased sharply to 96.4 per 1,000, reflecting a substantially earlier average age of retirement. Thus the mean age at retirement decreased over the last 10 years from 65.1 years in 1961 to 60.1 years in 1971.

Summary

The 1971 working life table indicates an average expectation of 47.3 years for Canadian males in the labour force, or in other words, about one-half year less than the length of working life anticipated in 1961. Considering that the total life expectation has remained virtually stable, the decline in the length of working life means an increase of approximately 0.8 years in the retirement life over the past 10 years. Looking ahead 15 years, it is likely that the working life expectancy could further decline to 46.8 years and the retirement life could rise to 9.7 years. The chief explanation for these changes, in the past as well as the future, lies in the changing pattern of labour force participation and in particular, the trend toward earlier retirement.

With regard to the dynamic aspects of the labour force, the 1971 working life table reveals that the average age of entry into the labour force has gone up over the past decade from 17.5 to 19.1. The retirement pattern has also undergone important changes. The mean age of retirement has decreased from 64.3 years in 1961 to 63.0 years in 1971.

For more details, see *Working Life Tables for Males in Canada and Provinces, 1971,* by K.S. Gnanasekaran and G. Montigny. Ottawa: Information Canada, 1975. This publication (Catalogue 71-524E, Occasional) is available at Publications Distribution, Statistics Canada.

Marketing Handbook

The 1975 edition of the *Market Research Handbook,* collecting in a single volume reference information necessary for those who analyze the many aspects of markets for a variety of goods and services, is now available.

The handbook pulls together information normally found in a score of different Statistics Canada publications. The result is a one volume work that gives a detailed picture of such things as trends in population growth, income, consumer consumption and shopping centre development, vital to any market analyst. The figures are applicable from the local right up to the national level.

For each of the volume's six subsections, a list of the specific publications from which primary figures were obtained is included.

For further information, order the 1975 edition of *Market Research Handbook* (Catalogue 63-224, $3.50).

Canadian Statistical Review

Data in this publication were retrieved from CANSIM^R (Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, or tape.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:
CANSIM Summary Reference Index (Annual with periodic amendments).
This index is a summary of the data in CANSIM. It provides a key to the Series Directory and is the first step in locating and ordering series from the system. Free on request.
CANSIM Series Directory (Annual with periodic amendments).
The Series Directory is a detailed guide to the data on CANSIM. It gives the title, start date, source of the data, and other descriptive material. The Directory is published in three volumes which can be purchased for $15.00 per volume or a complete three volume set can be purchased for $30.00.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following Statistics Canada staff members:

G. Leclerc (Chairman) – Assistant Chief Statistician, Economic Accounts and Integration Field
V. Berlinguette – Assistant Chief Statistician, Business Statistics
R.E. Drover – Director, User Advisory Services Division
F. Emmerson – Co-ordinator, Financial Statistics
W. M. Illing – Director, Prices Division
R. Platek – Director, Household Surveys Development Staff
J.R. Podoluk – Director General, Household Statistics Branch
J. Randall – Director, Financial Flows and Multinational Enterprises Division
L.O. Stone – Senior Advisor, Population Studies and Statistics, Census
P.N. Triandafillou – Director, Current Economic Analysis Division
J.S. Wells – Director General, Gross National Product Division

Inflation in Canada: The Impact of Export and Import Prices

A. Meguerditchian*

The rapid price increases of the last three years have obviously been an international phenomenon, a fact which is frequently alluded to but which appears to have received little quantitative analysis in terms of its effects on the measurement of Canadian prices. However, given the exceptionally high rates of change in foreign sector prices in the past few years, and given the importance of external trade to the Canadian economy, it is essential that export prices be taken into account when increases in the GNP price index are analyzed, and particularly when they are compared to movements in the same index in the U.S. Similarly, when measures of demand prices such as the final domestic demand deflator and the Consumer Price Index are considered, it is often important to determine how much of a given price increase is due to Canadian production prices and how much to import prices.

This note reports the results of a preliminary analysis of the impact of export and import prices on Canadian production and demand prices. World wide demand pressures, supply shortages (particularly in the agricultural sector), and the international energy crisis during the final quarter of 1973 marked the beginning of the recent inflationary years. The explosion in world prices affected food, raw materials and metals. In 1973 Canadian wheat export prices increased by over 50 per cent, copper by nearly 30 per cent and crude petroleum by 27 per cent. The importance of these prices is illustrated by the fact that one fifth of the increase in the GNE implicit price index in 1973, and one third in 1974, was due to increases in export prices. Thus, although the Canadian GNE implicit price index increased at significantly higher rates than that of the U.S. deflator in those years, the gap in the movements of the price index of GNE excluding exports was much less significant, particularly in 1974. Contrary to the impression given by the overall GNE implicit price index and the implicit price index of domestic demand or the CPI, the relative performance of prices in the Canadian economy does not appear to be significantly worse than in the U.S. economy. As in Canada, the deflator of production for domestic demand in the U.S. in 1975 does not seem to have decelerated from 1974. Thus, to some extent the apparent marked deceleration in U.S. demand prices, compared to Canada, has resulted from changes in import prices.

Production Prices (the GNE Implicit Price Index)

The price of an economy's total production is measured by the GNE (or GNP) implicit price index. During the eight years 1965–1972 inclusive, this price index increased in Canada at moderate rates of about three to five per cent and then accelerated strongly in the years 1973–1975, to rates of 8.4, 13.8 and 9.7 per cent, respectively (see Table I and Chart I at end of text). The pattern was virtually the same in the U.S. except that in 1973 the price increase remained relatively moderate, although it did accelerate from 1972. The GNP price index in the U.S. increased at rates of about 2.0 to 51/2 per cent between 1965 and 1972, and by 5.9, 9.7 and 8.7 per cent in 1973, 1974 and 1975 respectively. In contrast to Canada, the price increase grew progressively larger between 1965 and 1970 inclusive, except for 1967 growing from 2.2 in 1965 to 5.4 in 1970. Although both Canadian and U.S. production price indexes accelerated strongly in 1973 and 1974, Canada experienced higher increases than the U.S. The gap between the Canadian and U.S. GNP implicit price index increases was particularly evident in 1973 and 1974, Canada experiencing increases of about 2.5 and 4.0 percentage points more than the U.S. This difference narrowed in 1975 to about one per cent. There has been an appreciable slowdown in the Canadian implicit price index in 1975 and, to a lesser degree, in the U.S. index. We will reexamine these decelerations further in our study.

One of the main differences between the structure

---

*A. Meguerditchian is the head of the Analysis Section of the Gross National Product Division. This article has first been published in *National income and expenditure accounts (Catalogue 13.001).*

of the Canadian and U.S. economies is the external sector. Exports represented over 20 per cent of GNP in real terms in Canada during the last three years, but less than nine per cent in the U.S. Because the Canadian economy is far more dependent on the external sector, it is important to consider its impact when comparing U.S. and Canadian production prices. Export prices increased at similar rates in both countries, increasing moderately from 1965 to 1972 and at exceptionally high rates during the last three years. If export prices had any effect in the gap between Canadian and U.S. GNE price index increases, then it was due to the differing importance of the external sector in each of the economies.

One measure of the impact of export prices on GNP prices is obtained by deducting exports from current and constant dollar GNE and then deriving an implicit price index for GNE excluding exports. This calculation presupposes that export industries are not dependent on imports as inputs in the production process; if they are, such inputs should be excluded. If this assumption is considered roughly valid, however, then we may attempt to approximate a measure of GNE excluding exports[1] this way.

Table 1. Production and Export Price Indexes, Canada and United States. Percentage Increases

United States:											
GNE	2.2	3.4	2.9	4.6	5.0	5.4	5.0	4.2	5.9	9.7	8.7
GNE excluding exports	2.2	3.2	3.0	4.7	5.2	5.2	5.3	4.2	5.1	7.9	8.7
Exports	2.8	3.1	1.3	1.5	3.0	5.9	3.8	3.5	15.9	27.4	10.3

The price index increases for GNE excluding exports are shown in Table 1 and Chart 2 at end of text. As may be expected, the price indexes for total GNE and for GNE excluding exports moved at virtually the same rates in the U.S. from 1965 to 1975, with the exception of 1974, when the export price index registered an extremely strong increase of about 30 per cent. In Canada both price indexes also moved at about the same rates, except for the years 1973 and 1974, when the increase in the price index for total BNE was larger than the increase in the price index of GNE excluding exports, by over 1.5 percentage points in 1973 and by five percentage points in 1974. Thus, although the GNE price index moved in Canada by 2.5 and four percentage points more than in the U.S. during 1973 and 1974, the gap was much less significant in the case of the price index of GNE excluding exports, around 1.5 and 0.8 percentage points. The differences between the Canadian and U.S. GNE price index increases is therefore due to prices of production for domestic demand and, to a lesser extent, to exports in 1973, while it is mostly due to exports in 1974.

In 1975, the increase in the GNE price index was lower than in 1974 in both countries. Canada however, registered a much stronger deceleration than the U.S.: the increase in the GNE implicit price index in Canada was 9.7 per cent in 1975 compared to 13.8 per cent in 1974, while in the U.S. the increase was 8.7 per cent in 1975 compared with 9.7 per cent in 1974. The gap between the Canadian and U.S. GNE movements thus narrowed to one percentage point in 1975 compared to nearly four percentage points in 1974. This is due to the substantial slowdown in export prices, from an increase of 30 per cent in 1974 to an increase of 10.4 per cent in 1975. In contrast to 1974 and, to a certain extent, to 1973, the higher increase in the Canadian GNE price index, as compared to the U.S., is due entirely to price increase in commodities produced from domestic use (GNE excluding exports). The price index of GNE excluding exports experienced in Canada a higher rate of increase in 1975 than in 1974. The same phenomenon seems to have occurred in the U.S. though to a lesser extent. It is interesting to note here that although the movements in the Canadian implicit deflators for GNE and GNE excluding exports were similar prior to 1973, the latter nevertheless did increase

[1] GNE excluding exports consists of commodities produced by Canadians to satisfy domestic demand.

at consistently higher rates. This resulted from lower price increases in exports as compared to increases in the price index of GNE excluding exports.

Domestic Demand Prices

We will refer here mainly to the price index of domestic demand and at a lesser extent to the consumer price index. Production and import prices are reflected in domestic demand prices. Domestic demand includes consumer and government expenditures and business capital formation. It is therefore equal to imports plus GNE excluding exports. As a result, the price index of domestic demand and the consumer price index increased moderately in Canada from 1965 to 1972 inclusive, and then increased strongly during the last three years (see Table 2 and Chart 3 at end of text). In the U.S. these two price indexes moved at moderate rates from 1965 to 1973, and experienced strong increases in 1974 and 1975. In both countries the CPI moved at much the same rate as the price index of domestic demand.

Table 2. CPI and Domestic Demand Price Index, Canada and U.S. Percentage Increases

	1965	1966	1967	1968	1969	1970	1971	1972	1973	1974	1975
Canada:											
Domestic Demand	3.1	4.3	3.8	3.4	4.5	4.5	3.5	4.8	7.2	11.9	10.9
CPI	2.4	3.7	3.6	4.0	4.6	3.3	2.9	4.8	7.5	10.9	10.8
United States:											
Domestic Demand	2.2	3.2	2.9	4.4	5.1	5.3	5.2	4.4	5.9	10.7	8.4
CPI	1.7	2.9	2.9	4.2	5.4	5.9	4.3	3.3	6.2	11.0	9.1

Except for the last three inflationary years, the price indexes of total production and domestic demand registered nearly the same movements in Canada, as shown in Table 3. The two price indexes increased at about the same rate in the U.S. except for the last two years. However, during 1973 and 1974, the price index of domestic demand in Canada increased at a lesser rate than the total GNE price index (7.2 and 11.9 per cent respectively for domestic demand compared to 8.4 and 13.8 per cent for GNE). In contrast, during 1975, final domestic demand showed a higher increase than GNE (10.9 compared to 9.7 per cent). The differences in the movements of the two price indexes during 1973 and 1974 are due to the substantial differences in the export and import price movements since 1973. In 1973 and 1974 the higher increases in Canada for the GNE price index as compared to the domestic demand price index resulted from higher export price compared to import (13.3 and 30 per cent respectively for export prices versus 8.4 and 21 per cent for import prices). In 1975 the situation was reversed: import prices moved at a faster rate than export prices, thus causing a higher increase for the domestic demand price index; import prices increased by nearly 14 per cent compared with an increase of 10.4 per cent in export prices. (See Charts 4 and 5 at end of text).

The situation in the U.S. was somewhat different as the GNE and domestic demand price indexes moved at virtually the same rates during the period 1965–75, except in 1974. In 1974 the price index of domestic demand increased by about one percentage point more than the GNP price index (10.7 per cent compared to 9.7 per cent). This difference in the U.S., where the economy is far less dependent on the external sector, is due to the exceptionally high increase of 44 per cent in import prices in 1974. In contrast to Canada, import prices in the U.S. moved at a similar rate to export prices in 1973, and much more rapidly than export prices in 1974.

The impact of import prices on demand prices becomes clearer if prices of imports are compared to prices of commodities produced for domestic use (GNE excluding exports), see Table 4. During the years 1965 to 1972 import prices increased in Canada at lower rates than the price index of commodities produced for domestic use. As a result, the price index for domestic demand increased less rapidly than the price index for GNE excluding exports during the same period. However, from 1973 to 1975 the situation was reversed. Import prices increased at higher rates than the price index of GNE excluding exports, particularly in 1974. Consequently, the domestic demand price index moved more rapidly than the price index of commodities

(continued on page 137)

Observations

Editorial Note

The *Canadian Statistical Review* is celebrating its fiftieth anniversary. In January 1926 the first issue of the *Monthly Review of Business Statistics* was released and it evolved to become the *Canadian Statistical Review*[1]. This occasion coincides with the introduction of a format composed and printed by the newest methods available.

A team from the CSR staff, graphics design and the printing products centre of Supply and Services completely redesigned and wrote specifications for this new approach. The concept calls for a heading and text file and a CANSIM data file stored on computer to be merged into photo-ready copy for printing.

Altogether the concept presents many advantages most notably, the readability and the timeliness. The production date of the tape has been chosen carefully to provide as much data as possible. The CSR staff are always examining new ways of presenting information to its readers. If you have questions or suggestions direct them to the *Canadian Statistical Review,* Statistics Canada, R.H. Coats Bldg., 23rd. Floor, Section M, Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

The CANSIM Cross-Classified System

CANSIM (Canadian Socio-Economic Information Management System) is Statistics Canada's computerized data base of aggregative information, and its supporting software. Recently the Executive Committee of Statistics Canada reaffirmed CANSIM's role as the official Statistics Canada vehicle for primary transmittal of machine readable data to the public. However, due to an earlier and greater demand for economic data than for social data, emphasis had been placed until recently on developing a data base consisting of a detailed set of economic time series pertaining to a large number of interrelated fields. In parallel to development of the data base, a software system has evolved through which time series can be easily entered, stored, retrieved and manipulated, in a uniform general format consistent with the input requirements of certain analytical packages.

In recognition of the increasing importance of and demand for social information, the Executive Committee excluded only micro data from its policy concerning CANSIM. However a large portion of social data is in the form of cross-classified tables rather than in the form of time series as is the case with most economic data. The existing CANSIM system, being oriented toward time series, is not efficient for handling cross-classified tables.

Consequently, the CANSIM Cross-Classified system has been under development for the past few months and is due to be completed shortly. This system will enable cross classified tables, of up to nine levels of cross classification, to be easily entered, stored and retrieved from the CANSIM data base. Retrievals will be possible in either interactive or batch mode and the former will include a prompt feature by which users will be led through a retrieval. Data retrieved can either be printed in a specified table format, or can be loaded as a matrix into an APL work space where it may be manipulated, if necessary in conjunction with other data (for example, from the CANSIM time series system).

During the next six months priorities will be assigned for loading data onto the base, a directory of TABLES will be prepared, manipulative routines will be developed and refined to handle standard applications, and users manuals will be prepared. Statistics Canada looks forward to making CANSIM's cross-classified system publicly available in the near future.

For further information on this system and its availability contact CANSIM, Statistics Canada, R.H. Coats Building, Ottawa K1A 0Z8 (613-995-7406).

[1] For further details see the Brief History of the Canadian Statistical Review in the June 1975 issue.

Statistical Data on the Performing Arts*

Performing arts companies could not survive without the financial support of governments and private firms. This is one of the principal facts that emerges from a study made by the Education, Science and Culture Division of 29 theatre companies, 13 music companies, 5 dance companies and 4 opera companies. The survey collected data on the companies' revenue, expenses, number of performances and attendance in 1974. The year 1974 was defined as the companies' financial year ending between January 1, 1974 and December 31, 1974.

This brief report will examine the sources of funds, the breakdown of expenses, the length of the season and the number of performances.

An outstanding result discovered by the study is that the grants awarded by the federal, provincial, municipal and regional governments and private firms account for 45 per cent to 55 per cent of the average revenue of the companies. The grants, revenue and expenses of the four groups (expressed in dollars) were as follows:

Category	Average grants	Average revenue[1]	Average expenses
Theatre	263,328	558,832	564,186
Music	486,338	931,668	922,422
Dance	635,249	1,209,771	1,300,256
Opera	446,025	965,594	1,074,520

[1] Including grants.

These data make it clear that the companies, most of which are in a deficit situation, would be in worse financial position without the grants. The average deficits before grants varied from $250,000 to $750,000.

Ticket sales accounted for 45 per cent of the revenue of opera and theatre companies and approximately 30 per cent of that of music and dance companies. Guarantees and other earned revenue (broadcasts, recordings, and so on) and other revenue (program sales, interest, and so on) accounted for less than 20 per cent of the total revenue for each discipline.

Some of the data give information on the contributions of the federal, provincial and municipal governments and private firms by spectator. The contributions and the total cost for each spectator were as follows:

Category	Federal government	Provincial governments	Municipal governments	Private firms	Total cost
	Dollars				
Theatre	1.58	.66	.23	.38	6.09
Music	1.39	.67	.31	.99	6.36
Dance	1.88	.81	.21	.68	7.32
Opera	2.87	1.89	.30	1.08	14.80

n other words, every time a Canadian attended a performance by a professional theatre company, he ndirectly received $2.85 from governments and private firms. In the case of symphony orchestras, he public and private contributions were $3.36 per spectator, for dance they were $3.58 and for opera $6.14. There are two possible explanations for the substantial difference between the contributions for heatre and those for opera. In the first place, since he total attendance at dramatic performances was higher than that for opera, the total grants were distributed among more spectators in the first case than the second, and consequently the contribution per spectator was lower. Second, since it costs more to produce an opera than a play, it is not surprising that governments make larger contributions to opera companies.

In addition, each dollar spent by company was broken down as follows:

---

*This note was prepared by Robert Cloutier, Analyst, Education, Science and Culture Division.

Category	Personnel expenses	Publicity	Administrative expenses	Other production expenses[1]	Other expenses[2]
Theatre	.65	.10	.05	.11	.09
Music	.81	.07	.03	.04	.05
Dance	.60	.08	.03	.21	.08
Opera	.58	.07	.03	.25	.07

[1] Other production expenses include the purchase, transport and rental of stage materials, sets, costumes and props, as well as technical supplies, ticket printing, and so on.

[2] Other expenses include space expenses (rental, mortgage payments and property taxes), costs of maintaining buildings, heat, water, power, maintenance supplies, and so on.

In the case of theatre, dance and opera companies, approximately two-thirds of the personnel expenses went to the artistic personnel, while the other third went to the technical, administrative and other personnel, such as ushers, box office clerks, maintenance staff, and so on. In the case of music companies, 90 per cent of the personnel expenses went to the artists. The high percentage of each dollar attributed to personnel expenses by music companies should be noted.

The number of performances and the attendance at performances was as follows:

Category	Average length of the season (in weeks)	Average number of performances	Average attendance per performance
Theatre	38	238	327
Music	35	134	1,082
Dance	38	117	1,519
Opera	25	44	1,650

Similar data are available for 1973, as well as a more detailed study of the companies' financial situations. The latter appeared in Service Bulletin No. 81-001, Vol. 5, No. 1. For further information, please contact the author at:
Fine Arts and Media Section, Education, Science and Culture Division, Statistics Canada, Ottawa, Ontario, Tel: (613) 995-9682.

---

[1] The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2] Includes logging, fishing, trapping and hunting. [3] Includes mechanical and construction. [4] Includes a small number in non-specified occupations. [5] Does not include students entering Canada on students' visas. [6] Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force.

Section 3 · System of National Accounts

1. Income and Expenditure Accounts

28 1.1 National Income and Gross National Product
28 1.2 Gross National Expenditure, Current Dollars
29 1.3 Gross National Expenditure, Constant Dollars
29 1.4 Sources of Personal Income
30 1.5 Disposition of Personal Income
30 1.6 Sources and Disposition of Gross Savings
31 1.7 Government Revenue, Expenditure, and Surplus of Deficit, by Level of Government
35 1.8 Implicit Price Indexes
35 1.9 Relation between Gross National Product at Market Prices and Gross Domestic Product at Factor Cost

2. Domestic Product by Industry

36 2.1 Real Domestic Product by Industry of Origin, Quarterly
37 2.2 Real Domestic Product by Industry of Origin, Monthly

3. Balance of International Payments

42 3.1 Canadian Balance of International Payments, Current Account, All Countries
42 3.2 Canadian Balance of International Payments, Current Account, Country Distribution
43 3.3 Canadian Balance of International Payments, Capital Account, All Countries

1–Income and expenditure accounts

---

[1] Excludes profits (net of losses) of government business enterprises. [2] Includes the withholding tax applicable to this item. [3] Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. [4] Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5] Includes net income of independent professional practitioners. [6] See footnote 4, Table 1.2.

---

[1] Includes defence expenditures. [2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4] The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment, (as shown in Table 1.1). [5] See footnote 4, Table 1.1.

---

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change

[1] Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. [2] Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3] Withholding taxes. [4] The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unad-usted for seasonality, and therefore may be used as indicators of price change.

or source see Table 1.9.

---

[1] The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). [2] The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation)

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001

[1] Persons who have applied for or are in receipt of unemployment insurance benefit at the end of the month. [2] Annual figures are averages of 12 months. [3] Includes adjustments for cancellation of warrants and collection of overpayments. [4] Trainees under the Adult Occupation Training Act receiving U.I. benefit, prior to July 1975 included with regular benefit

[1] Vacancies for full-time, casual, part-time, seasonal and temporary jobs which were immediately available. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the mail sample was reduced. These estimates should be used with caution due to their reduced reliability.

---

[1] A vacancy rate is obtained by expressing the number of vacancies per thousand existing jobs (sum of vacant and filled jobs) in all industries, except agriculture, fishing and trapping, domestic service and the non-civilian component of public administration and defence. Both full-time and part-time jobs are included. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the mail sample was reduced. These estimates should be used with caution due to their reduced reliability.

In calculating time lost, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as those laid off as a esult of a work stoppage, is not included. [2]The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. From January 1973 forward, he 1970 S.I.C. is used. [3]The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days luring the stoppage. Adjustments are made for establishments on shift work, etc [4]The statistics for individual industries exclude strikes and lockouts involving fewer than 00 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown eparately. Should strikes occur in these industries, the time lost also will be shown in the total In addition, the total is revised quarterly whereas the individual categories re revised annually [5]Includes miscellaneous manufacturing industries. [6]Includes publishing and allied industries. [7]Includes storage and communication industries

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2] Excludes agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households, public administration and defence. [3] Includes storage, electric power, gas and water utilities [4] Excludes domestic service

[1] See footnote 1 and source in Table 10. [2] Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 9. [3] In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. [4] Except machinery and transportation equipment industries.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below.

[2] In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing.

---

[1] These rounded weights, provided as a general guide, show the relative importance of the major components of the C.P.I., on average, during the year 1974. [5] Includes shelte and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements.

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments. for these a monthly estimate of work put in place has been substituted. [2] Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3] Total manufacturing inventory owned by manufacturers including warehouse stocks.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated

[1] Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2] Intended for cigarettes [3] Includes pipe, plug, chewing, twist, snuff etc. [4] Includes sales to wholesalers or retailers. [5] Subject to Excise Tax. [6] Includes sales for ships' stores and for export [7] End of period.

---

100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. [2]Total pulp production covers "screen-gs" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. [3]Customs exports. [4]Mill shipments destined for xport.

ources: Pulpwood and Wood Residue Statistics (25-001), Trade of Canada, Exports (65-004), Statistics Canada; Bulletins of Canadian Pulp and Paper Association nd Newsprint Association of Canada.

[1] Data compiled according to the Steel Distribution Index revised January, 1964 Figures on net shipments relate to semi finished and rolled steels products only. Shipments to consuming industries of castings forgings and steel pipe are not included [2] Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3] Includes appliances and utensils. [4] Excluding shipments for re-processing at maker's own plant

Production plus imports less re-exports, minus exports. [2] Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and dis- ibutors) was based on "actual cost to purchaser" rather than the suggested list price as in the past.

ources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), Statistics Canada.

[1] Gas types are included. [2] Includes producers' shipments for export. [3] In some cases these shipments are not at the factory level, and stocks at beginning of month plus production less shipments do not equal stocks at end of month. [4] End of period. [5] Electric and other. [6] Excludes apartment type machines. [7] Excludes other than electric. **Sources: Domestic Refrigerators and Freezers (43-001), Domestic Washing Machines and Clothes Dryers (43-002), Trade of Canada, Exports (65-004), Imports (65-007), Statistics Canada.**

[1] Includes record players. [2] Includes producers' shipments for export. [3] Radio phonograph combinations. [4] Includes monaural and stereo with and without amplifiers. [5] Excludes producers' shipments for export. [6] Included with "total television receivers". [7] Customs clearance; radio sets include all types; television sets include colour and black and white. **Sources: Radio and Television Receiving Sets (43-004); Trade of Canada, Imports (65-007), Statistics Canada.**

Section 7 · Fuel, Power, Mining

[1] These totals include all generating agencies producing over twenty million kilowatt hours per year. [2] These columns include all generating utilities and generating industries respectively, producing over twenty million kilowatt hours per year. [3] Less imports. [4] Total net generation less net exports

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. [1] Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc. [2] Includes crude oil, condensate and pentanes plus. [3] Gross new production by field less field flared and waste.

---

[1] Barrels of 35 Canadian gallons. [2] Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3] Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4] Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5] Includes inventories at end of period being held at gas plants and in storage caverns. [6] Includes stove oil, kerosene. [7] Includes aviation gasoline and aviation turbo fuel. [8] Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9] Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products

A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data e the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on sample basis quarterly.

ource: Housing Starts and Completions (64-002), Statistics Canada.

te: Components may not add to totals due to rounding differences. [1] Data are on a gross basis i.e. they do not take account of cancellations or alterations of loans after tial approval. [2] Agency loans (loans made by other lending institutions on behalf of C.M.H.C.) are included under C.M.H.C. [3] Includes fraternal and mutual benefit socie- s, Quebec savings banks and, since May 1967, chartered banks. [4] Includes new and existing commercial structures and farm property.

urce: Canadian Housing Statistics, Central Mortgage and Housing Corporation.

[1] In this context, "softwood" refers to wood from coniferous trees, and hardwood to wood from broadleafed species. [2] Includes export shipments; the softwood lumber column includes domestic shipments are somewhat higher. [4] Production for these items. As reported by principal manufacturers. Total production is somewhat higher. [5] Building contractors, public and utility construction and structural steel fabricators

---

[1] Cash receipts from farming operations excluding supplementary payments. Excludes Newfoundland. [2] Represents participation payments made by the Canadian Wheat Board direct to producers on crops delivered in previous years. [3] Includes rye, flaxseed, rapeseed, soybeans and corn. [4] Includes clover and grass seed, hay, clover, greenhouse, mustard seed, sunflower seed, hops, dry beans and dry peas and miscellaneous products. [5] Made under the authority of the Agricultural Stabilization Act.

Note: Components may not add to totals due to rounding. [1] The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. [2] Excluding trucks. [3] The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers

---

[1] Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2] 1973 and 1974 price indexes are subject to revision. [3] 1974 price indexes are subject to revision. [4] Farm share only of motor vehicles. [5] In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6] In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2] Production is calulated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3] Includes baking and frying oils and its. [4] Includes stocks held by manufacturers and other warehouses. [5] Includes fresh sausage, frankfurters, weiners and all other sausage. [6] Includes solid, coated, bulk, ackages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 970, be collected on the basis of factory sales.

ources: Grain Milling Statistics (32-003), Oils and Fats (32-006), Quarterly Reports, Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017) nd Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001), Monthly Report, Meat and Meat Preparations, Statistics Canada.

Note: Components may not add to totals due to rounding and partial revisions. [1] Fully secured by marketable bonds and stocks. Excludes loans to finance the purchase of Canada Savings Bonds. [2] Includes loans on the security of household property. [3] Not available on a monthly basis. [4] Includes loans to finance companies which are affiliates of retail merchandisers. [5] Religious, educational, health and welfare institutions. [6] Differs from general loans in Section 13, Table 2 by the exclusion of loans to instalment finance companies

Note: Components may not add to totals because of rounding

[1] Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities. Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit. [2] Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. [3] Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [4] Personal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5] Includes bank-sponsored credit card balances. [6] The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present: this series is repeated in the unadjusted form. [7] Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. [8] Bills due for non-commercial use of telephones, gas and electric power. [9] Personal cash loans only. The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form.

---

olumn numbers refer to tables 3 and 4 section 11. [2] Includes special transaction-trade, not shown separately [3] The annual index, being calculated separately, will differ ghtly from the index obtained by the average of the twelve months. [4] Revisions made to ensure consistent coverage The most important are Farm machinery (73) now ludes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc.

urce: Trade of Canada, Exports (65-004), Statistics Canada.

Table 4: Merchandise imports, by commodity, based on the standard commodity classification[1] (million dollars)

Column numbers refer to tables 3 and 4, section 11. [2]The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3]Includes special transaction-trade, not shown separately. [4]Includes scrap. [5]Some series such as General purpose machinery have been revised to ensure con-istent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports (65-007), Statistics Canada.**

Data for 1970 through 1972 refer to 24 class 1 and 2 carriers whose gross annual revenues totalled $500,000 or more. Commencing January 1973, only 6 major railways (accounting for 95 per cent or more of the total operating revenues) are shown.

Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. [2]Cargo includes air freight and express but excludes mail and excess baggage.

---

[1]Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2]Daily averages for period. [3]Mainly deposits of foreign banks. [4]Capital, rest fund and undivided profits as at the latest fiscal year-end. [5]Including issues payable in foreign currency. [6]Excluding Canadian day-to-day loans. [7]Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8]Loans to grain dealers and exporters. [9]Loans to finance purchase of Canada Savings Bonds at time of issue. [10]Including loans to instalment finance companies. [11]These series reflect the combination of two CANSIM series.

Note: Components may not add to totals because rounding. [1] This series was designed to cover 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined [2] Seasonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted.

[1] Excluding revivals, increases, dividend additions, reinsurance acquired, credit insurance and pension bonds without insurance. Value totals are estimates projected from the sales reported by companies operating in Canada representing over 80% of new ordinary and of new group contracts. [2] Total new settled-for ordinary sales in Canada. [3] Total sales figure does not include sales for Northwest Territories. [4] Under new or amended contracts

[1] The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. [2] The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3] Combines the industrials, utilities and finance common stocks. [4] Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5] Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. [6] Stocks included in the mining index are for producing mines.

[1] This statement includes only receipts relating to budgetary revenue. Excluded are non-budgetary revenues such as Old Age Security Fund taxes, Prairie Farm Assistance Act levies, employer and employee contributions to government-held funds (Unemployment Insurance, Superannuation etc.), interest on government-held funds, and taxes collected on behalf of and transferred to other governments. [2] Beginning in December 1973, this category includes oil export tax. [3] March includes supplementary payments arising from the closing of the accounts. **Sources: The Canada Gazette and Dept. of Finance.**

roduced for domestic use, particularly in 1974. As e price indexes of imports and GNE excluding xports experienced strong rates of increase from 1973 on, the domestic demand price index registered high rates of inflation during the years 1973 to 1975, particularly in 1974 and 1975.

the U.S. the domestic demand price index also oved more rapidly than the price index of GNE cluding exports during 1973 and 1974. In 1975 e increases were similar for both price indexes. s in Canada the domestic demand price index oved strongly from 1973 on, particularly in 1974 d 1975, but at lower rates than in Canada. The p was 1.3 percentage points in 1973, 1.2 per ntage points in 1974, and a more significant 2.5 rcentage points in 1975. Because import prices creased in the U.S. twice as rapidly as in Canada, 1973 and 1974, the gap between the rates of crease of U.S. and Canadian domestic demand ices may be attributed to the differences in U.S. d Canadian production price increases and to the relative importance of imports in the two economies. The contribution of production prices to the gap between the Canadian and U.S. domestic demand price increases may be seen through the difference in the rate of increase between the Canadian and U.S. price indexes of GNE excluding exports. This gap, in percentage points, was 1.6 in 1973, 0.8 in 1974 and 1.3 in 1975, compared to gaps of 1.3, 1.2 and 2.5 respectively in demand prices as mentioned above. As a result, the higher price increases in domestic demand prices in Canada as compared to U.S. is due entirely to production prices in 1973, to production and to a lesser extent to imports in 1974, and to both production and import prices in 1975.

It is interesting to note here that both the Canadian and U.S. domestic demand price indexes decelerated in 1975, from 11.9 to 10.9 per cent in Canada, and from 10.7 to 8.4 per cent in U.S. Because prices of commodities produced for domestic use seem to have accelerated in 1975, particularly in Canada, the deceleration in domestic prices in both countries is due to the slowdown in import prices. The stronger deceleration in domestic demand prices in U.S., as compared to Canada is due largely to the very strong slowdown in import prices in the U.S. Import prices in the U.S. increased by 11.7 per cent in 1975 compared to 44 per cent in 1974. In Canada, import prices moved at a higher rate than in the U.S. in 1975, and at a lower rate in 1974.

Some conclusions may be derived from this preliminary analysis. Roughly 20 per cent of the increase in the GNE implicit price index in 1973, and about 35 per cent in 1974, is due to the exceptionally high increases in export prices. Although the total GNE implicit price index moved much more rapidly in Canada than in the U.S. for the same two years, the gap was less significant in the case of the price index of GNE excluding exports. In contrast to the U.S., Canada as a whole benefited in relative terms from world inflation as the terms of trade swung in our favour. Thus, the subtantially higher rates of inflation in exports, as compared to import prices, contributed to foreign currency inflow to Canada. However, given the importance of the external sector, the inflationary pressures on demand resulting from higher foreign sector prices may indirectly increase production prices of commodities produced for domestic use. This situation seems to have been experienced from 1973 on and particularly in 1974 and 1975. In fact, during the first seven years of the decade, the price increase of domestic demand and GNE excluding exports showed moderate rates of inflation. From 1973 on, and particularly from the fourth quarter of 1973 on, the strong price increases in the external sector coupled with the existing domestic inflationary pressures, led to high rates of inflation. Further, contrary to the impression given by the overall GNE implicit price index and the implicit price index of domestic demand or the CPI, there does not seem to be a significant general slowdown in production prices in the Canadian and U.S. economies in 1975. In fact, as the price index of GNE excluding exports does not seem to have experienced a slowdown, the easing in the overall GNE price index and in demand prices are due mainly to a slowdown of prices in the external sector. The more marked slowdown in U.S. demand prices as compared to Canada is due mostly to the very substantial deceleration of import prices in the U.S.

Canadian Statistical Review

Data in this publication were retrieved from CANSIM^R (Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, or tape.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:
CANSIM Summary Reference Index (Annual with periodic amendments).
This index is a summary of the data in CANSIM. It provides a key to the Series Directory and is the first step in locating and ordering series from the system. Free on request.
CANSIM Series Directory (Annual with periodic amendments).
The Series Directory is a detailed guide to the data on CANSIM. It gives the title, start date, source of the data, and other descriptive material. The Directory is published in three volumes which can be purchased for $15.00 per volume or a complete three volume set can be purchased for $30.00.

To obtain either of these documents or for further information on CANSIM please contact: CANSIM, Current Economic Analysis Division, Statistics Canada, Ottawa K1A 0Z8, (613) 995-7406.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following Statistics Canada staff members:

G. Leclerc (Chairman) – Assistant Chief Statistician, Economic Accounts and Integration Field
V. Berlinguette – Assistant Chief Statistician, Business Statistics
R.E. Drover – Director, User Advisory Services Division
F. Emmerson – Co-ordinator, Financial Statistics
W. M. Illing – Director, Prices Division
R. Platek – Director, Household Surveys Development Staff
J.R. Podoluk – Director General, Household Statistics Branch
J. Randall – Director, Financial Flows and Multinational Enterprises Division
L.O. Stone – Senior Advisor, Population Studies and Statistics, Census
P.N. Triandafillou – Director, Current Economic Analysis Division
J.S. Wells – Director General, Gross National Product Division
Dr. M. Wisenthal – Director General, Institutions and Public Finance Branch
M. Meguerditchian – Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at : Current Economic Analysis Division, 23rd. Floor, Section M, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

Note to Users

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Special Notice

Initial programming restrictions will prevent us from having symbols in the first few issues. The user is urged to scan the data available to determine what revisions have been made from the previous issue. Further information is always available in the source publications or from the *Canadian Statistical Review*, 23rd. Floor, Section M, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6, (613) 995-0575.

A New Approach to the Dissemination of CANSIM® Data

Gina Pilozzi*

Rationale

The new CANSIM dissemination concept described below has emerged from the need to rationalize the extensive and complex pattern of arrangements for data dissemination through secondary distributors. In order to explain the concept and its rationale we must first sketch the situation as it has evolved to the present time.

Standardization and the CANSIM Mini Base

In the past few years the number of secondary distributors[1] of CANSIM data, and the number of series they distribute, has grown rapidly. In 1973 there were eight organizations distributing roughly 5,500 series which were updated monthly or quarterly. Today there are at least 14 secondary distributors which offer to their clients subsets of CANSIM data varying from 5,500 series to some 20,000 series. Furthermore, each of these organizations updates its CANSIM subset at different times and with varying frequency. Each also provides its own documentation (Series Directory) to its clients. The manner of updating varies from one organization to another. Some update a series by retrieving a complete historical replacement for it from the CANSIM Main Base[2]; others have attempted, without complete success, to retrieve only the data points that have been revised since the last update of the appropriate series.

It will be evident from this brief description that a rather chaotic situation was evolving; that the accuracy and timeliness of the secondary bases, relative to the main base, varied widely; and that the end user might understandably be confused about the availability of data from CANSIM. (Indeed, we have encountered clients of secondary distributors who thought they were accessing the whole CANSIM base at the secondary location, and consequently were unaware of the availability of many more series from CANSIM itself.)

The concept of the CANSIM Mini Base[3], a standard subset of the CANSIM Main Base, has evolved in response to the need to bring some order to the current situation. Under this concept, all secondary distributors of data from CANSIM will be required to offer at least the CANSIM Mini Base to their clients, and to refer to it as such. Also, to ensure accuracy and timeliness of the CANSIM Mini Base at all its locations, each secondary distributor will be required to subscribe to the CANSIM tape service for maintenance of its CANSIM Mini Base. This service consists of a daily update file plus a periodic historical replacement file, and is controlled by Statistics Canada. This concept will ensure the user that a standard product is available at all locations, and that the standard is of a high quality in terms of timeliness and accuracy relative to the CANSIM Main Base. The standardization of the CANSIM Mini Base, and its relationship to the CANSIM Main Base, will be emphasized by publication of the *CANSIM Mini Base Series Directory*[4]. As well as listing the series available in the CANSIM Mini Base, this document will explain the CANSIM Mini Base concept. It will be published and disseminated by Statistics Canada for a fee of $10.00 per year per copy, and secondary distributors may not provide their own documentation in lieu of the *CANSIM Mini Base Series Directory*.

CANSIM® – Registered Trade Mark of Statistics Canada

*Gina Pilozzi is in charge of the CANSIM Customer Advisory Services Group, Current Economic Analysis Division, Statistics Canada.

[1] Secondary Distributors – All organizations which re-disseminate data from CANSIM.

[2] CANSIM Main Base – The system which consists of data, the CANSIM data entry software, the CANSIM retrieval software, and the houskeeping software.

[3] CANSIM Mini Base – The CANSIM Mini Base is documented and supported by Statistics Canada. It is the subset of data from CANSIM chosen by the Technical Committee for Dissemination. This Committee consists of representatives of Statistics Canada, the host bureau and all secondary distributors of CANSIM data. This group will coordinate the technical implementation and maintenance of the CANSIM Mini Base.

[4] *CANSIM Mini Base Series Directory* – A document produced by Statistics Canada which will include a list of only the series in the CANSIM Mini Base. All textual information pertaining to this data which appears in the current *CANSIM Series Directory* will be included.

In order to maintain flexibility in the ability of secondary distributors to meet the needs of their clients, secondary distributors may offer data, originating from the CANSIM Main Base, over and above the contents of the CANSIM Mini Base. However, secondary distributors will be responsible for updating and for providing documentation (Series Directory) for any series they maintain in addition to those of the CANSIM Mini Base, and they must maintain a clear distinction between the CANSIM Mini Base and any additional data offered.

Equitable Treatment of All Secondary Distributors

A second aspect of the current situation that has influenced the new concept relates to the role Statistics Canada has played in supporting the host bureau[5] and other secondary distributors. When the current host bureau first won the CANSIM contract (November 1973), there were other distributors of CANSIM data, and the number of clients accessing data via the main base, and other bases, was relatively small. Consequently Statistics Canada decided to market CANSIM through the main base, and by implication, through the host bureau. In light of this decision, it seemed natural to measure the success of CANSIM in terms of the number of clients and the volume of business generated by CANSIM at the host bureau. (This tendency to measure the success of CANSIM in terms of the marketing success of the host bureau was reinforced by the fact that other distributors, until recently, have not kept records of the volume and pattern of data usage, and have not made available to Statistics Canada client lists.) However, as more secondary distributors entered the field, this particular approach to measuring the success of CANSIM (number of clients and volume of usage at the host bureau) forced Statistics Canada into an undesirable situation in which it felt it was competing with secondary distributors for CANSIM business. Statistics Canada hopes to rectify this situation through this CANSIM dissemination concept by:

A · Measuring CANSIM success in terms of number of clients and volume of usage generated by all secondary distributors of CANSIM data. To help implement this concept, secondary distributors will be asked to keep statistics files on usage of the CANSIM Mini Base, as well as on usage of other data from CANSIM Main Base that are disseminated, and to provide Statistics Canada with a monthly report of these usage patterns.

B · Offering official Statistics Canada support and advisory service to all secondary distributors of the CANSIM Mini Base. This service will include (1) answering user questions on content, timeliness and availability of data on the CANSIM Mini Base; (2) assistance in holding joint seminars with secondary distributors and discussing content, timeliness and availability of data on the CANSIM Mini Base (resources permitting); (3) on request of secondary distributors, or their clients, providing liaison with Statistics Canada divisions, or other sources which have data that is of interest to end users, with a view to loading this data on the CANSIM Main Base; (4) providing five free copies of the *CANSIM Main Base Series Directory*[6] for each office of all secondary distributors; (5) informing potential users of the availability of the CANSIM Mini Base.

C · Minimizing any special relationship between Statistics Canada and the host bureau with regard to the dissemination of data from CANSIM by: (1) no longer supporting a national telecommunication network to the installation of the host bureau; (2) no longer providing CANSIM series directories, free of charge, to CANSIM Main Base users; (3) participating in CANSIM seminars with all secondary distributors rather than just the host bureau as has been the practice in the past.

A Mechanism for Disseminating the CANSIM Main Base

A third aspect of the new policy – easily overlooked but equally important as the previous points – is that the CANSIM Mini Base concept, besides constituting a vehicle for disseminating the current contents of the CANSIM Mini Base, is part of a dynamic process through which the entire CANSIM base can be disseminated via all secondary distributors. As was mentioned earlier, secondary distributors will keep statistics files on usage of the CANSIM Mini Base data as well as on usage of other series from the CANSIM Main Base that are disseminated.

Besides providing a measure of the overall performance of the CANSIM system, these files will be used to determine when a series becomes popular enough in terms of frequency of access and number of secondary distributors disseminating the series, to be incorporated into the CANSIM Mini Base. The contents of the CANSIM Mini Base will be reviewed every six months and in this way the CANSIM Mini Base constitutes a vehicle for disseminating the CANSIM Main Base.

---

[5] Host bureau – The organization which houses the CANSIM Main Base. The host is SMA (Société de Mathématiques Appliquées Inc.) until November, 1977.

[6] *CANSIM Main Base Series Directory* – document produced by Statistics Canada which will include a list of all series on the CANSIM Main Base.

The success of this process will depend upon user awareness of the mechanism for moving series from the CANSIM Main Base to the CANSIM Mini Base, and on ready access to a *CANSIM Main Base Series Directory.* To ensure user awareness, the mechanism will be explained in the *CANSIM Mini Base Series Directory,* in CANSIM seminars, etc., and Statistics Canada will provide five free copies of the *CANSIM Main Base Series Directory* for each office of every secondary distributor.

Guidelines

Implementation

Statistics Canada will implement the concept effective June 1, 1976.

A · All secondary distributors and the host bureau must offer at least the CANSIM Mini Base and refer to it as such.

B · To ensure timeliness, coverage, and consistency of data in the mini bases offered by secondary distributors, each organization must subscribe to the CANSIM tape service for maintenance of their CANSIM Mini Base. This service consists of a daily update file plus a replacement file (in standard IBM format).

C · Participating secondary distributors will provide a list of their clients to the CANSIM staff. This list will be kept in strictest confidence by Statistics Canada. It will be used for purposes such as the determination of printing plans for the *CANSIM Mini Base Series Directory.* Before any announcement is sent to persons or organizations on this mailing list, all secondary distributors will be consulted. Without consultation, the only information that would be sent to those on the mailing list would relate to the contents, timeliness, and availability of the data on the CANSIM Mini Base.

D · Secondary distributors will keep records of the usage and updating of the CANSIM Mini Base as well as on the usage of other data from the CANSIM Main Base that are disseminated. The secondary distributor is responsible for writing the software required. A monthly report on usage and updating will be provided to Statistics Canada. Statistics Canada will determine the content of the records.

E · Retrieval from the CANSIM Mini Base for purposes of tertiary distribution will not be permitted. Statistics Canada will ask all users of the CANSIM Main Base and CANSIM Mini Base to sign a contract to this effect.

F · A technical committee consisting of representatives of Statistics Canada, the host bureau, and participating secondary distributors has been formed to coordinate the technical implementation and maintenance of the CANSIM Mini Base. The committee met for the first time on March 29, 1976.

Standardization of the Content of the CANSIM Mini Base

To the extent feasible the data disseminated by secondary distributors will be standardized.

A · The initial content of the CANSIM Mini Base will be determined by considering requests of the participating secondary distributors. For this purpose Statistics Canada has requested a list of Databank Identification Numbers and/or CANSIM Identification Numbers from each participating organization. These are to be provided in the form of machine readable files.

B · To ensure standard documentation for the CANSIM Mini Base Statistics Canada will publish and disseminate the *CANSIM Mini Base Series Directory* for a fee of $10.00 per year per copy including amendment service. Secondary distributors may not provide their own documentation (Directory) in lieu of the Statistics Canada *CANSIM Mini Base Series Directory.*

C · Secondary distributors may offer data originating from the CANSIM Main Base in addition to the CANSIM Mini Base. The secondary distributor will be responsible for providing documentation (Directory) of any data they maintain in addition to those of the CANSIM Mini Base. They must maintain a clear distinction between the CANSIM Mini Base and any additional data offered.

D · If secondary distributors offer data originating from the CANSIM Main Base in addition to the CANSIM Mini Base, the secondary distributor will be responsible for the updating of these additional data.

E · The content of the CANSIM Mini Base will be reviewed in three months (September, 1976) and thereafter every six months. There will be two criteria for *adding* or *deleting* data to the CANSIM Mini Base: 1) number of secondary distributors disseminating the data, and 2) number of users accessing the data.

(continued on page 137)

Observations

Seminar on Occupational Research

A seminar on occupational research recently took place in Statistics Canada. At that seminar two tables were presented that might be of interest to readers involved in occupational studies:

Occupational Classification Manual, Comparison Tables 1971 to 1961

These tables enable researchers to aggregate detailed 1971 occupational statistics so that they become generally comparable with 1961 data classified at the broad "Division" level. French introduction only.

Classification Discrepancies Between the 1971 OCM and CCDO

These tables indicate occupations that have been classified differently in Statistics Canada's Occupational Classification Manual (OCM) and the Department of Manpower and Immigration's Canadian Classification and Dictionary of Occupations (CCDO). Such a listing is of use:

a) to assist researchers wishing to relate statistics gathered according to the OCM and CCDO classifications systems

b) to assist in the conduct of occupational surveys employing some 7-digit occupational codes (found only in the CCDO) and consequently requiring the use of the CCDO in conjunction with the OCM

c) to assist vocational counsellors and others wishing to relate the definitions and background material found in the CCDO to survey data gathered on the OCM base

d) to assist analysts wishing to compare titles, definitions and structural elements of the OCM and CCDO.

French introduction only.

A few copies of these tables are still available and may be obtained by writing Frank Levin, Standards Division, Statistics Canada, Ottawa, Ontario, K1A 0T6.

Literary and Journalistic Awards in Canada 1923 – 1973

For several decades, Canadian authors have been receiving literary awards; these awards aim at encouraging and honoring our writers. Statistics Canada thought it important to preserve the name of those persons and the titles of their works which won them such honors.

The publication *Literary and Journalistic Awards in Canada 1923 – 1973* (Catalogue 81-407) is a summary of the literary and journalistic awards given to Canadian authors over the 51 years studied. Prizes given cover almost all literary genres: poetry, novel, short story, humor, drama, history, biography, books for young people and journalism. These prizes are awarded by various bodies, namely: the federal government, provincial and municipal administrations, associations of writers, librarians and artists, publishing houses, journals, newspapers, universities, theatre groups, industrial and commercial firms, as well as other associations or individuals interested to some extent in literature. Finally a short description of the prize preceeds the lists of winners.

Certain criteria had been established to define the area under study. The criteria can be broken down into four categories: frequency of award, subject matter, nature of the award and the rules governing the eligibility of candidates.

With respect to frequency, only annual prizes awarded during five years at least have been taken into account: occasional prizes have been omitted. In the area of the subject matter, the publication deals with literary and journalistic awards, those have been eliminated which, while not completely outside the literary realm, are primarily awarded for other categories. With respect to the matter of the awards, we have recorded only the names of those winners who received material recognition: cash, medals, trophies, ... As for eligibility, the prizes must be awarded to individuals. Those given to periodicals, with no mention of the author, do not appear in the list.

For further information regarding the publication *Literary and Journalistic Awards in Canada 1923 – 1973* please contact the Fine Arts and Media Section, Education, Science and Culture Division, Statistics Canada, Tunney's Pasture, Ottawa, Ontario K1A 0T6. Tel. (613) 995-9682

Domestic and Foreign Control of Manufacturing Establishments in Canada*

Foreign ownership and control are significant factors in many branches of Canadian industry. The measurement of their magnitude and an understanding of their impact are thus vital for the policy-making process.

Most of the statistical data published on this topic have been in the form of corporate or enterprise financial statistics. Such tabulations have mainly treated domestic and foreign ownership in relation to assets, remittances of income and other payments to non-residents, industry financial statements and ratios and other information of a financial nature.

On four occasions over a long period of years, however, special studies were undertaken by the Dominion Bureau of Statistics, predecessor of Statistics Canada, to analyze establishment data of the Census of Manufactures in relation to domestic and foreign control. Because this Census is on an establishment basis, using reporting units approximately equivalent to plants, factories or mills, it is possible to obtain various operational statistics not normally available for companies, such as numbers of persons employed, value added, value of shipments of goods of own manufacture, cost of materials and supplies used and the like. In addition, Census of Manufactures establishments may be assigned conveniently to four digit industries of the Standard Industrial Classification (S.I.C), to provinces and even to municipalities. By contrast, corporations or enterprises may own plants in a variety of industries and provinces making such distributions impracticable on a satisfactory basis. In addition, the Census of Manufactures includes unincorporated business, an important component of Canadian controlled activity in some small geographical areas.

However, all four special studies had one limitation or another as to their coverage. Those for 1932, 1946 and 1953 included only establishments controlled in the United States. Studies for 1946, 1953 and 1961 covered only establishments belonging to enterprises having more than one million dollars of long-term investment in Canada. It has also become obvious that the level of public interest in issues surrounding domestic and foreign control of industry makes regularly available statistics of this nature for manufacturing establishments desirable. Accordingly, a new series of biennial reports, *Domestic and Foreign Control of Manufacturing Establishments in Canada,* has been introduced, the first number of which has appeared. Representing the first regular, comprehensive accounting for domestic and foreign control of Canadian manufacturing establishments, it provides a wealth of detail for four-digit industries of the Standard Industrial Classification and, in the first issue, for provinces and Census Metropolitan Areas by industry group and for province by industry group and leading industries.

In accompanying bar charts in this issue of the *Canadian Statistical Review,* national industry groups and all-industry totals for provinces and for Census Metropolitan Areas are ranked according to their percentage of total employees in foreign-controlled firms. The accompanying Tables 1 and 2 summarize the percentages of domestic or foreign control of employees, of total value added and of value of shipments of goods of own manufacture for those industries where either foreign or domestic control exceeds 80 per cent of total employees. However, because industries must be excluded in some cases because the breakdown between domestic and foreign control groups is confidential to protect individual businesses as provided in the Statistics Act, no conclusions should be drawn from these tables concerning the relative preponderance of industries with heavy foreign or heavy domestic control. The data as presented here are intended to give only a generally informative and illustrative picture.

Capital Expenditures

Another feature of this report, a joint undertaking of the Manufacturing and Primary Industries Division and the Business Finance Division of Statistics Canada, is the first set of data ever prepared on domestic and foreign control of capital expenditure data for the manufacturing industries as collected by the Construction Division in the annual Survey of

---

*This note was prepared by Mr. H.D. Potter, Manufacturing and Primary Industries Division.

Table 1. Manufacturing Industries with Domestic Control Exceeding 80 per cent of total Employees (Excluding Industries for which Data are Confidential Under the Statistics Act), 1970

			Percentage Reported by Domestic Controlled Establishments		
S.I.C.	Industry	Total Employees	Total Employees	Total Value Added	Value of Shipments
2541	Sash, Door and Other Millwork Plants, n.e.s.	11,038	97.6	97.6	97.1
2890	Publishing and Printing	32,828	97.4	97.3	96.7
2870	Platemaking, Typesetting and Trade Bindery Industry	6,715	97.4	96.2	96.3
3080	Machine Shops	14,221	97.3	97.1	97.4
3041	Metal Coating Industry	3,793	95.9	90.7	89.2
2441	Women's Clothing Factories	30,457	95.2	94.7	95.3
3549	Concrete Products Manufacturers, n.e.s.	5,348	91.7	88.3	88.4
1012	Poultry Processors	7,479	89.6	88.4	88.0
2619	Household Furniture Manufacturers, n.e.s.	20,992	89.5	90.3	90.2
3970	Signs and Displays Industry	5,506	88.6	86.9	91.6
2392	Other Knitting Mills	12,515	87.2	84.0	86.9
3020	Fabricated Structural Metal Industry	19,104	86.6	86.8	85.4
2542	Hardwood Flooring Plants	1,177	86.6	86.5	85.4
1060	Feed Industry	9,485	85.9	75.8	80.6
1011	Slaughtering and Meat Processors	31,099	85.3	83.8	86.2
2860	Commercial Printing	38,874	84.8	83.0	83.4
2910	Iron and Steel Mills	49,169	84.7	85.5	85.7
2431	Men's Clothing Factories	34,230	84.6	84.9	86.1
3511	Clay Products Manufacturers (from domestic clays)	2,958	84.5	82.8	84.5
3541	Concrete Pipe Manufacturers	1,907	83.4	70.3	74.9
1072	Bakeries	30,081	82.8	77.4	78.3
2660	Miscellaneous furniture and Fixtures Manufacturers	13,062	82.2	81.2	84.0
3280	Boat building and Repair	2,705	80.5	81.2	76.9
3995	Stamp and Stencil (Rubber and Metal) Manufacturers	1,144	80.2	78.1	78.4

Capital Expenditures, using the mailing list of the annual Census of Manufactures. The results are essentially comparable with those of the Census of Manufactures (apart from revisions to the Standard Industrial Classification).

These distributions show that foreign-controlled firms accounted for 54 per cent of capital expenditures by the manufacturing industries in 1969 and 53 per cent in 1970. The United States, as might be expected from other information, accounted for the largest foreign-contolled capital expenditures. Its share of all manufacturing industry capital expenditures amounted to 42 per cent in 1969 and 39 per cent in 1970. The corresponding figures for manufacturers controlled in other foreign countries were 12 per cent and 14 per cent. The percentage of foreign control of capital expenditures in 1970 varied from 99 per cent in the petroleum and coal products industries to only 4 per cent in the printing, publishing and allied industries. Foreign control accounted for 95 per cent of such expenditures in the rubber industries, the second highest percentage, and for 14 per cent in the clothing industries, the second lowest. The volatility of capital expenditures data, affected in 1970 by a slowdown in the economy, is emphasized by a drop in the foreign control of the wood industries' capital expenditures from 28 per cent in 1969 to 23 per cent in 1970.

Special Analysis

Some special analysis of foreign control and spatial concentration and of the average sizes of establishments controlled in Canada and in other countries are included in the report. In general, these show that foreign-controlled manufacturing industry is more highly localized than is Canadian-controlled manufacturing industry. Table 3 accompanying this present text shows the distribution of the value added of establishments controlled in Canada and in other countries according to establishments size groupings.

The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. [2] Includes logging, fishing, trapping and hunting. [3] Includes mechanical and construction. [4] Includes a small number in non-specified occupations. [5] Does not include students entering Canada on students' visas. [6] Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force.

---

[1] Excludes profits (net of losses) of government business enterprises. [2] Includes the withholding tax applicable to this item. [3] Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. [4] Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5] Includes net income of independent professional practitioners. [6] See footnote 4, Table 1.2.

---

[1] Includes defence expenditures [2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises Excludes defence construction and equipment which is defined as current expenditure [3] Includes capital expenditures by private and government business enterprises private non-commercial institutions and outlays on new residential construction by individuals and business investors Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4] The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change The difference between the value of physical change and the change in book value is called the inventory valuation adjustment, (as shown in Table 1.1). [5] See footnote 4, Table 1.1.

The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dol- r figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts hich occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based n seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change

---

[1] Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance. [2] Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3] Withholding taxes. [4] The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

For source see Table 1.9.

---

[1] These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

For source see Table 1.9.

---

[1] The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). [2] The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

vacancy rate is obtained by expressing the number of vacancies per thousand existing jobs (sum of vacant and filled jobs) in all industries, except agriculture, fishing and pping, domestic service and the non-civilian component of public administration and defence. Both full-time and part-time jobs are included. [2]Includes Prince Edward Is-d and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3]Due to postal strike the mail sample was reduced. These estimates uld be used with caution due to their reduced reliability.

---

calculating time lost, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as those laid off as a ult of a work stoppage, is not included. [2]The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. From January 1973 forward, 1970 S.I.C. is used. [3]The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days ng the stoppage. Adjustments are made for establishments on shift work, etc. [4]The statistics for individual industries exclude strikes and lockouts involving fewer than 0 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown arately. Should strikes occur in these industries, the time lost also will be shown in the total. In addition, the total is revised quarterly whereas the individual categories revised annually. [5]Includes miscellaneous manufacturing industries. [6]Includes publishing and allied industries. [7]Includes storage and communication industries.

urce: Research Bulletin, Labour Canada.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2] Excludes agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households, public administration and defence. [3] Includes storage, electric power, gas and water utilities [4] Excludes domestic service.

The data for the current year are subject to revision. [2] Includes gold. [3] Consists of general wholesale index less animal products and vegetable products component groups. [4] Consists of iron products and non-ferrous metals products component groups less gold. [5] These two series comprise the general wholesale index. [6] Excludes gold.

---

[1] These rounded weights, provided as a general guide, show the relative importance of the major components of the C P I, on average, during the year 1974 [5] Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements

Section 6 · Manufacturing

72 1. Total Inventories, Shipments, Orders
73 2. Manufacturing Shipments, Selected Industries
75 3. Manufacturing Inventories, Selected Industries
77 4. Manufacturing Shipments and Unfilled Orders by Economic Use Classification
78 5. Manufacturing Inventories Owned and Raw Materials by Economic Use Classification
79 6. Manufacturing Goods in Process and Finished Products by Economic Use Classification
0 7. Tobacco and Beverages
0 8. Rubber
1 9. Rubber Products
1 10. Raw Hides, Skins, Finished Leather
2 11. Footwear Production
2 12. Primary Textiles
3 13. Production of Sawn Lumber
3 14. Pulpwood, Wood Pulp and Newsprint
4 15. Primary Iron and Steel
5 16. New Motor Vehicles
6 17. Refrigerators, Freezers, Washing Machines and Clothes Dryers
6 18. Radio and Television Sets

Table 1: Total inventories, shipments and orders in manufacturing based on the 1970 standard industrial classification (million dollars)

Annual average and month	Shipments[1]	New orders received during month[2]	Unfilled orders at end of month	Inventory at end of month						Ratio of inventories owned to shipments
						All inventory held				
				Owned[3]	Held but not owned	Total	Raw materials	Goods in process	Finished products

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments for these a monthly estimate of work put in place has been substituted [2] Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3] Total manufacturing inventory owned by manufacturers including warehouse stocks

---

00 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. [2] Total pulp production covers "screen-gs" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. [3] Customs exports. [4] Mill shipments destined for port.

ources: Pulpwood and Wood Residue Statistics (25-001), Trade of Canada, Exports (65-004), Statistics Canada; Bulletins of Canadian Pulp and Paper Association d Newsprint Association of Canada.

---

[1] Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to semi finished and rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. [2] Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3] Includes appliances and utensils. [4] Excluding shipments for re-processing at maker's own plant.

[1] These totals include all generating agencies producing over twenty million kilowatt hours per year. [2] These columns include all generating utilities and generating industries respectively, producing over twenty million kilowatt hours per year. [3] Less imports. [4] Total net generation less net exports.

---

[1] Barrels of 35 Canadian gallons. [2] Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. [3] Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. [4] Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. [5] Includes inventories at end of period being held at gas plants and in storage caverns. [6] Includes stove oil, kerosene. [7] Includes aviation gasoline and aviation turbo fuel. [8] Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. [9] Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data re the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on sample basis quarterly.

ource: Housing Starts and Completions (64-002), Statistics Canada.

[1] Cash receipts from farming operations excluding supplementary payments. Excludes Newfoundland. [2] Represents participation payments made by the Canadian Wheat Board direct to producers on crops delivered in previous years. [3] Includes rye, flaxseed, rapeseed, soybeans and corn. [4] Includes clover and grass seed, hay, clover, greenhouse, mustard seed, sunflower seed, hops, dry beans and dry peas and miscellaneous products. [5] Made under the authority of the Agricultural Stabilization Act.

Note: Components may not add to totals due to rounding. [1]The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. [2]Excluding trucks. [3]The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers.

[1] Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2] 1973 and 1974 price indexes are subject to revision. [3] 1974 price indexes are subject to revision. [4] Farm share only of motor vehicles. [5] In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6] In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

ustoms exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2]Production is cal-
lated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3]Includes baking and frying oils and
s. [4]Includes stocks held by manufacturers and other warehouses. [5]Includes fresh sausage, frankfurters, weiners and all other sausage. [6]Includes solid, coated, bulk,
ckages and novelties. [7]The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of
70, be collected on the basis of factory sales.

urces: Grain Milling Statistics (32-003), Oils and Fats (32-006), Quarterly Reports, Biscuits and Confectionery (32-016), Fruit and Vegetable Preparations (32-017)
d Miscellaneous Food Preparations (32-018), Monthly Production of Soft Drinks (32-001), Monthly Report, Meat and Meat Preparations, Statistics Canada.

---

Note: Components may not add to totals because of rounding.

[1] Credit extended mainly to individuals and chiefly for personal consumption expenditures. Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities. Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers and other personal service credit. [2] Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. Amounts shown exclude unearned finance charges. [3] Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [4] Personal cash loans over $1,500, usually repaid in instalments. Amounts shown exclude unearned finance charges. [5] Includes bank-sponsored credit card balances. [6] The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present: this series is repeated in the unadjusted form. [7] Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms, and international travel and entertainment credit card issuing companies. [8] Bills due for non-commercial use of telephones, gas and electric power. [9] Personal cash loans only. The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality: this series is repeated in the unadjusted form.

Column numbers refer to tables 3 and 4 section 11. [2]Includes special transaction-trade, not shown separately. [3]The annual index, being calculated separately, will differ ightly from the index obtained by the average of the twelve months. [4]Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now cludes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc.

ource: Trade of Canada, Exports (65-004), Statistics Canada.

---

[1] Column numbers refer to tables 3 and 4, section 11. [2] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3] Includes special transaction-trade, not shown separately. [4] Includes scrap. [5] Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports (65-007), Statistics Canada.**

eginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Pro-cial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Ca-dian commercial air carriers. [2]Cargo includes air freight and express but excludes mail and excess baggage.

[1] Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2] Daily averages for period. [3] Mainly deposits of foreign banks. [4] Capital, rest fund and undivided profits as at the latest fiscal year-end [5] Including issues payable in foreign currency [6] Excluding Canadian day-to-day loans. [7] Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8] Loans to grain dealers and exporters. [9] Loans to finance purchase of Canada Savings Bonds at time of issue. [10] Including loans to instalment finance companies. [11] These series reflect the combination of two CANSIM series

ote: Components may not add to totals because rounding. [1] This series was designed to cover 50 clearing house centres. With the advent of centralized data processing, ank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may ot remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined. [2] Seasonally adjusted data for Sas- atchewan have been deleted because current data could not be satisfactorily adjusted.

ource: Cheques Cashed in Clearing Centres (61-001), Statistics Canada.

[1] The number of stocks included has varied over the period, the totals shown in the column headings represent the current coverage. [2] The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. [3] Combines the industrials, utilities and finance common stocks. [4] Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. [5] Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. [6] Stocks included in the mining index are for producing mines.

Figures are rounded and may not add to totals shown

[1] For comparative purposes figures may differ from those previously reported to reflect changes in accounting during 1973-74 **Source: The Canada Gazette and Dept. of Finance**

(continued from page 7)

Cost to secondary distributors

The cost to organizations wishing to be secondary distributors will be $1,500 per month. New entrants[7] will pay $600 per month for the first six months and $1,500 per month thereafter. This fee will initially be reviewed after three months (September, 1976) and thereafter every six months. The criterian used for changing this fee will be: if the number of series on the CANSIM Mini Base is 25,000 series or less the fee will not change until October 31, 1977, and if the number of series is greater than 25,000, Statistics Canada guarantees that the monthly increase will not be greater than the monthly cost to an organization to retrieve this data from the host bureau (on a daily update basis).

Statistics Canada's New Role

A · Any organization disseminating the CANSIM Mini Base will receive official Statistics Canada support, rather than just that of the host bureau.

B · The host bureau must be a secondary distributor of the CANSIM Mini Base. The software for the host bureau's Mini Base may have the option to pass a request to the CANSIM Main Base for data that is not included in the CANSIM Mini Base.

C · Statistics Canada will no longer support a national telecommunication network to the installation of the host bureau.

D · Statistics Canada will inform potential users of the availability of the CANSIM Mini Base.

E · Statistics Canada will provide advisory service to all secondary distributors of the CANSIM Mini Base. This service will include: (1) answering user questions on content, timeliness and availability of data on the CANSIM Mini Base; (2) assistance in holding joint seminars with secondary distributors and discussing content, timeliness and availability of data on CANSIM; (3) liaison with Statistics Canada divisions or other sources with data that is of interest to end users.

F · All demonstrations done by Statistics Canada will use the CANSIM Main Base.

G · Statistics Canada will no longer provide CANSIM Series Directories free of charge to CANSIM Main Base users.

H · Statistics Canada will provide a maximum of five free copies of the *CANSIM Main Base Series Directory* for each office of all secondary distributors.

Questions concerning CANSIM may be directed to Gina Pilozzi at CANSIM, Current Economic Analysis Division, Statistics Canada, Ottawa, K1A 0Z8 (tel. (613) 995-7406) or to the Regional Advisor at the Statistics Canada offices located across Canada. A list of the Regional Advisors was published in the December 1975 issue of the *Canadian Statistical Review.*

---

[7] New entrants– Organizations who have not been distributors of data originating from CANSIM and providing data which was being updated on a regular basis prior to January, 1976.

Canadian Statistical Review

Data in this publication were retrieved from CANSIM® (Registered Trade Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Summary Reference Index (Annual with periodic amendments) – Free on request.

This index is a summary of the data in CANSIM. It provides a key to the Series Directory and is the first step in locating and ordering series from the CANSIM Main Base.

CANSIM Main Base Series Directory (Annual with periodic amendments) – $30,00.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material. The Directory is published in three volumes.

CANSIM Mini Base Series Directory (Annual with periodic amendments) – $10,00.

This Directory is a detailed guide to the data on the CANSIM Mini Base – a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used in Statistics Canada is the U.S. Bureau of the Census Method II, X-11 variant. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average per cent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following Statistics Canada staff members:
G. Leclerc (Chairman) – Assistant Chief Statistician, Economic Accounts and Integration Field
V. Berlinguette – Assistant Chief Statistician, Business Statistics
R.E. Drover – Director, User Advisory Services Division
F. Emmerson – Co-ordinator, Financial Statistics
W. M. Illing – Director, Prices Division
R. Platek – Director, Household Surveys Development Staff
J.R. Podoluk – Director General, Household Statistics Branch
J. Randall – Director, Financial Flows and Multinational Enterprises Division
L.O. Stone – Senior Advisor, Population Studies and Statistics, Census
P.N. Triandafillou – Director, Current Economic Analysis Division
J.S. Wells – Director General, Gross National Product Division
Dr. M. Wisenthal – Director General, Institutions and Public Finance Branch
M. Meguerditchian – Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at : Current Economic Analysis Division, 23rd. Floor, Section M, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

Subscriptions

The *Canadian Statistical Review* and other catalogued publications of Statistics Canada, including a free annotated catalogue of current publications, may be ordered from Publications Distribution, Statistics Canada, Ottawa, K1A 0T6 and remittances made payable to the Receiver General for Canada.

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers.

Historical data for selected economic indicators, both unadjusted for seasonal variation, are distributed to subscribers in an Annual Supplemment.

Correspondence should be directed to the *Canadian Statistical Review,* Current Economic Analysis Division, Statistics Canada, R.H. Coats Tower, Ottawa, Ontario, K1A 0T6.

Note to Users

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Industry Selling Price Indexes – Section 5, Table 1

With this issue the Industry Selling Price Indexes series have been rebased from 1961 = 100 to a 1971 base. Series on the 1961 base will continue to be available from CANSIM although they will not be updated and the series on the 1971 base can be found under the new CANSIM numbers listed.

National Income and Expenditure Accounts
First Quarter 1976 – Advance Information

Following normal practice, data from 1971 to 1975 have been revised. These revisions have, in some components, been larger than usual, and users should be aware that the first quarter estimates for 1976 may also be subject to larger than usual revisions. A discussion and analysis of the revisions will be provided in the second quarter publication, National Income and Expenditure Accounts (Catalogue 13-001) to be released in late September.

The economic recovery gained considerable momentum in the first quarter of 1976, as Gross National Product, seasonally adjusted at annual rates, increased 4.4 per cent to a level of $176.5 billion; after adjustment for price changes, real GNP grew 2.7 per cent. This was the fourth consecutive quarterly increase in output volume since the recovery began, and it left real GNP over 5 per cent higher than at the trough of the recession one year ago. Most of the first quarter growth was due to a massive restocking of inventories rather than a strengthening of final demand, however, and in fact, both gross fixed capital formation and personal expenditure on goods declined. As a result, the 0.7 per cent increase in real final domestic demand was well below the growth in real GNP. There was also a deterioration in the external sector, as the balance of trade in goods and services fell despite a fairly large rise in exports. The swing in inventories from a liquidation of almost $2 billion last quarter to an accumulation of $2.5 billion in the first three months of the year more than compensated for these weaknesses and was responsible for strengthening the recovery after its rather weak start last year. The fact that the inventory swing dominated the quarter to the extent it did may be cause for some concern: first, because inventory accumulation is almost certainly not sustainable at anything like the first quarter rate, and second, because there are some grounds for believing that some of it may have been unintended.

Incomes

After an unusually weak fourth quarter, wages, salaries and supplementary labour income increased 4.5 per cent and accounted for most of the rise in GNP measured in income terms. The first quarter strength was due to a number of factors, including the settlement of strikes in several industries, the ending of the distorting effects of large third quarter cost-of-living allowance payments, and higher employer contributions to publicly controlled welfare plans. The goods-producing industries rose by 5.0 per cent while the service-producing industries increased by 3.8 per cent and because the recovery has not yet generated much increase in labour demand, most of this was attributable to higher average earnings. First quarter pre-tax corporation profits fell 4.5 per cent after a 1.5 per cent increase in the fourth quarter, as profits declined in both manufacturing and mining. This movement appears to be attributable in part to declining windfall profits on inventories, which in turn is a result of a deceleration in prices.

As a result of the strong performance of labour income in the first quarter, together with a 6.6 per cent rise in interest, dividends and miscellaneous investment income and a 2.0 per cent increase in net income of non-farm unincorporated business, personal income increased a healthy 4.1 per cent. Personal income tax collections were up 17.3 per cent however, with the net result being a very moderate 1.7 per cent rise in personal disposable income. At the same time, personal expenditure on goods and services grew 2.0 per cent, and the personal saving rate thus fell to 9.0 per cent from 9.4 per cent last quarter.

Personal Expenditures

In real terms, personal expenditure increased 0.5 per cent in the first quarter. Spending on goods declined 0.4 per cent, as expenditure on durables fell 7.5 per cent; this drop was caused by a weaker automobile market, which no doubt reflects to some extent the re-imposition of the Ontario sales tax on motor vehicles. Spending was reasonably strong on both semi-durables and non-durables, and expenditure on services grew 2.0 per cent in real terms, much of which was a result of higher foreign travel expenditure. The implicit price index for total personal consumption slowed to a 1.5 per cent increase from 2.2 per cent in the fourth quarter, with the implicit price index for non-durable expenditure growing by a marginal 0.1 per cent, reflecting lower food prices.

Fixed Capital Formation

Total gross fixed capital formation reached a level of $42.7 billion in the first quarter, an increase of 0.9 per cent from the level of the previous three months; in real terms, this represents a decline of 0.8 per cent. This drop took place despite a 5.0 per cent increase in real investment in residential construction, as business investment in plant and equipment fell 2.2 per cent in real terms. The early explosive growth in housing starts appears to have peaked and over three-quarters of the growth in residential construction represents carry-over from starts made in previous quarters. This suggests that residential construction is unlikely to resume its earlier very substantial growth, at least in the near future. The short term outlook for investment in plant and equipment does not point to strong growth as the Public and Private Investment survey of intentions for 1976 is for 7.9 per cent growth in current dollars. In the first quarter, business investment in machinery and equipment fell 0.7 per cent in real terms, which left it well below the level of a year ago, and business non-residential construction declined 3.7 per cent after a strong fourth quarter.

Inventory Investment

The value of the physical change in inventories, at $2.5 billion, neared the levels of the immediate pre-recession period and formed a very high 5.7 per cent of total saving. This accumulation followed heavy liquidation in the fourth quarter, and the resulting $4.4 billion swing was the largest ever recorded. All of the change from the fourth quarter occurred in business non-farm stocks, and was concentrated in wholesale and retail trade. As a result of the accumulation, stock-to-sales ratios increased in both wholesale and retail trade, although the stock-to-shipments ratio declined slightly in manufacturing.

The very large contribution made to the recovery by inventory accumulation in the first quarter has been a widespread international phenomenon which has attracted some comment. While stock building is obviously not a sustainable source of long run growth, inventory build-ups have in the past frequently acted as a bridge between the strong personal expenditure typical of early recovery quarters and later improvements in the trade balance and business investment in plant and equipment. The first quarter build-up was therefore welcome in what was otherwise not a particularly strong quarter. The exceptionally large magnitude of the inventories accumulated suggest, however, that the re-stocking phase of this recovery may be even shorter lived than usual. Moreover, although some rebuilding of inventories might have been expected at about this stage of the cycle, the simultaneous appearance of massive inventory accumulation and very weak personal expenditure on goods raises the possibility that at least part of the stock building was involuntary. The fact that much of the accumulation appears to have occurred in industries in which consumption was particularly weak – for example, automobiles – might be interpreted as supporting this conclusion.

The External Sector

Exports of goods and services increased strongly in the first quarter, growing 5.1 per cent in current dollars and 5.8 per cent in real terms. Not surprisingly, the largest absolute increase was in exports to the USA, where the recovery is well underway, but there were larger percentage increases in exports to Japan and to the EEC. Because the 6.2 per cent increase in imports was larger than the growth in exports, however, the deficit on trade in goods and services increased by over $750 million at annual rates. Nevertheless, on a year over year basis, there does not appear to have been a significant substitution of imports for domestic production; imports have absorbed about 30 per cent of the increase in real final domestic demand in the past year, which is only slightly more than the import content of final domestic demand in 1973 and 1974.

Prices

The overall implicit price index for Gross National Expenditure decelerated in the first quarter, increasing by 1.7 per cent compared with 2.4 per cent last quarter. As mentioned earlier, the implicit price index for personal expenditure slowed to a 1.5 per cent increase from 2.2 per cent, largely due to a very substantial deceleration in the index for non-durables. The price index for gross fixed capital formation also slowed considerably, increasing 1.7 per cent after a 2.7 per cent rise in the fourth quarter, and the implicit price index for exports of goods and services declined 0.8 per cent.

The Government Sector

Total revenue of all levels of government combined, excluding intergovernmental transfers, increased by 7.7 per cent, a much sharper rate of increase than in the previous quarter. Almost three quarters of the gain was in revenues from personal direct taxes, which rose 13.7 per cent from an irregularly low fourth quarter rate; in absolute terms, the increase was split about equally between the federal and provincial governments. Revenues from indirect taxes also rose sharply and reflected mainly higher rates of provincial sales taxes and local property taxes. Total expenditures of all levels of government rose by 3.8 per cent in the quarter. Outlays on current goods and services increased at all levels of government, although the rise was strongest at the federal level, particularly in defence expenditures. There were higher interest payments on the public debt, concentrated at the federal level, while the other expenditure components showed smaller and offsetting movements. With the increase in government revenues greater than in expenditures, the deficit of the government sector, seasonally adjusted at annual rates and on a national accounts basis, narrowed from $4.1 billion in the fourth quarter to $1.8 billion in the first quarter.

Observations

Methodological Report on Measuring Income Inequality

The Consumer Income and Expenditure Division of Statistics Canada has been producing statistics on he Canadian income distribution by size since the early 1950's. These data describe one of the more mportant aspects of Canadian society today – how national income is distributed among the population. The extent to which income is not shared proportionately by different groups in society evokes much in-erest and debate. This report discusses the prob-ems associated with measuring income inequality nd presents a statistical methodology for analyzing data in this controversial area.

or those interested in income inequality data, two of he appendices may be of interest – one contains istorical inequality data for the period 1951-1973 nd the other decile summaries and inequality mea-ures for families and individuals by a variety of so-io-economic classifications for 1967 and 1971.

ncome Inequality: Statistical Methodology and Ca-adian Illustrations, Catalogue 13-559, is available or $2.10 from Publications Distributions, Statistics anada, Ottawa, K1A 0T6 or from Information anada stores across Canada.

nquiries about the contents of this publication may e directed to R. Love, Consumer Income and Ex-enditure Division, Statistics Canada, Ottawa, On-rio, K1A 0T6 (613-996-0990).

New Volume of Research Reports om Consumer Income and Expenditure ivision

April 1976, the Research and Analysis Section of e Consumer Income and Expenditure Division re-ased Volume II as a sequel to the collection of ports published in 1974 under the title *Survey of onsumer Finances: Volume I – Selected Reports, 970,* Catalogue 13-550. The empirical analyses ontained in these volumes are based on the asset nd debt data collected in the 1970 Survey of Con-umer Finances.

The present volume contains three reports. The first report examines the effect of money transfers received and money transfers paid on family incomes (mainly transfers from government to families and individuals and vice versa). The analysis examines the role that transfers received and compulsory payments such as income taxes, social security payments and union dues play in respect to the size of income left for spending or saving by families in different socio-economic groups.

The second report compares net worth of Canadian-born and immigrant families. The analysis complements the findings of an earlier study published in the May 1974 issue of the Canadian Statistical Review.

The third report examines the extent to which net worth of families is affected by changing asset prices. The leverage ratio indicates the relative position of families in that respect. The report presents some useful information on the characteristics of groups of families who could potentially gain or lose when asset prices are changing.

Survey of Consumer Finances: Volume II – Selected Reports, 1970, Catalogue 13-551, is available for $2.10 from Publication Distributions, Statistics Canada, Ottawa, K1A 0T6 or from Information Canada stores across Canada.

Inquiries about the contents of this volume may be directed to R.K. Chawla, Consumer Income and Expenditure Division, Statistics Canada, Ottawa, Ontario, K1A 0T6 (613-992-1695).

Consumer Prices and Price Indexes

This quarterly publication presents a compendium of consumer prices and price index related information of both a current and historical nature. It is the successor to the retail portion of *Prices and Prices Indexes* (Catalogue 62-002) which is discontinued with the December 1975 edition. This new publication provides a wider range of more timely and more detailed statistical information to better serve user needs.

Part I of this report presents a synopsis of current consumer price index movements for each of the three months in the reference quarter, at both the urban Canada and the regional cities' level. This is presented in the form of descriptive analysis supported by tabular and graphic information.

Part II provides a detailed historical summary of monthly consumer price index movements in recent years. This summary contains considerable disaggregated information, again in the perspective of both the urban Canada and the separate city contexts.

Place-to-place comparative retail price information forms Part III of the report. This segment presents the most recent data with regards to average city retail prices and inter-city indexes of retail price differentials.

Part IV contains Appendices serving as sources of reference for the statistical data presented in the preceding segments of the report. Appendix I provides explanatory notes pertaining to consumer price index data; Appendix II provides reference material for seasonal adjustment methodology in the context of its application to the Consumer Price Index; Appendix III presents background information relating to place-to-place retail price comparisons.

Further information with regards to the contents of this publication may be obtained by addressing inquiries to the Consumer Prices Section, Prices Division, Statistics Canada, Ottawa, (613-994-9470).

National Income and Expenditure Accounts

A complete record of estimates and a comprehensive description of definitions, concepts, sources and methods are now provided in three volumes published by Statistics Canada. Volume 3, announced in the November issue of the Canadian Statistical Review, describes the conceptual and statistical changes introduced in the historical revision. It also updates and expands on the concepts and methodology described in the last major reference document released in 1958. Volume 1, released in March incorporates the results of a major historical revision from 1926 to 1974; Volume 2, released in February covers quarterly estimates from 1947 to 1974.

Volume 1.	*The Annual Estimates, 1926-1974* (Catalogue 13-531, $5.25)
Volume 2.	*The Quarterly Estimates, 1947-1974* (Catalogue 13-533, $3.50)
Volume 3.	*A Guide to the National Income and Expenditure Accounts* (Catalogue 13-549-E, $6.75)

Any one or all of these publications can be obtained by writing to Publications Distribution, Statistics Canada, Ottawa, K1A 0T6. Please specify publication title desired and the catalogue number and include a cheque or money order for the specified amount payable to the Receiver General for Canada.

Statistics on Special Care Facilities

The first publication in a series of annual publications entitled *List of Special Care Facilities, 1974* was released in May. The information it contains is based upon a survey conducted by questionnaire in 1974 and from which a uniform national inventory of Special Care Facilities was compiled.

Included in the scope of the Inventory of Special Care Facilities are institutions commonly known as nursing homes, homes for the aged, the physically handicapped, the blind, the deaf, the mentally handicapped, emotionally disturbed children, alcoholics, and/or drug addicts, delinquents, unmarried mothers, etc., each institution having a minimum of four beds. As may be deduced from the above description the institutions listed in this publication provide nursing, custodial, and/or counselling services as opposed to the active medical treatment provided in the general and allied special hospitals. The list therefore complements the publication *List of Canadian Hospitals, 1974* (Catalogue 83-201).

This first publication will be supplemented with *Special Care Facilities – Institutional Facilities and Services,* (Catalogue 83-222) containing data on ownership, size, principal characteristics of the residents, levels of care received and in subsequent years, data on the operation and staffing of the facilities.

---

occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided he immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue ber 12-506. [2]Includes logging, fishing, trapping and hunting. [3]Includes mechanical and construction. [4]Includes a small number in non-specified occupations. [5]Does include students entering Canada on students' visas. [6]Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending nter the labour force.

Section 3 · System of National Accounts

1. Income and Expenditure Accounts

28 1.1 National Income and Gross National Product
28 1.2 Gross National Expenditure, Current Dollars
29 1.3 Gross National Expenditure, Constant Dollars
29 1.4 Sources of Personal Income
30 1.5 Disposition of Personal Income
30 1.6 Sources and Disposition of Gross Savings
31 1.7 Government Revenue, Expenditure, and Surplus of Deficit, by Level of Government
35 1.8 Implicit Price Indexes
35 1.9 Relation between Gross National Product at Market Prices and Gross Domestic Product at Factor Cost

2. Domestic Product by Industry

36 2.1 Real Domestic Product by Industry of Origin, Quarterly
37 2.2 Real Domestic Product by Industry of Origin, Monthly

3. Balance of International Payments

42 3.1 Canadian Balance of International Payments, Current Account, All Countries
42 3.2 Canadian Balance of International Payments, Current Account, Country Distribution
43 3.3 Canadian Balance of International Payments, Capital Account, All Countries

[1] Excludes profits (net of losses) of government business enterprises. [2] Includes the withholding tax applicable to this item. [3] Includes profits (net of losses) of government business enterprises and interest and miscellaneous investment income of government. [4] Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. [5] Includes net income of independent professional practitioners. [6] See footnote 4 Table 1.2

[1] Includes defence expenditures. [2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. [3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals and business investors. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. [4] The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment, (as shown in Table 1.1). [5] See footnote 4, Table 1.1.

---

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

[1] Includes the taxes on life insurance companies introduced in 1969. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The 1969 taxes are thus included here pending a complete review of the treatment of insurance [2] Excludes the special refundable tax on corporations introduced in May 1966. Refunding of the tax began in 1968. [3] Withholding taxes. [4] The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

For source see Table 1.9.

---

[1] These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

For source see Table 1.9.

---

[1] The labour force as a percentage of the population 14 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. Seasonally-adjusted participation rates are obtained by direct adjustment (i.e. by dividing the unadjusted participation rate by the seasonal factor). [2] The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex, etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation)

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001

ee footnotes, Table 3.

In addition to the selected Labour Force information published here, there are approximately 2,100 Labour Force series available on CANSIM. The series pro-
ide basic labour force characteristics, by geographic area, age, sex and marital status.

Table 4: Selected series by sex and main age group (thousands of persons)

[1] Vacancies for full-time, casual, part-time, seasonal and temporary jobs which were immediately available. [2] Includes Prince Edward Island and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the mail sample was reduced. These estimates should be used with caution due to their reduced reliability.

A vacancy rate is obtained by expressing the number of vacancies per thousand existing jobs (sum of vacant and filled jobs) in all industries, except agriculture, fishing and rapping, domestic service and the non-civilian component of public administration and defence. Both full-time and part-time jobs are included. [2] Includes Prince Edward Is-and and the Yukon and Northwest Territories for which separate reliable estimates are not available. [3] Due to postal strike the mail sample was reduced. These estimates hould be used with caution due to their reduced reliability.

[1] In calculating time lost, only the workers directly affected by the strike or lockout are taken into account: time lost by workers indirectly affected, such as those laid off as a result of a work stoppage, is not included. [2] The industry groups prior to January 1973 are based on the 1960 Standard Industrial Classification. From January 1973 forward, the 1970 S.I.C. is used. [3] The number of man-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. [4] The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; however, the total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. In addition, the total is revised quarterly whereas the individual categories are revised annually. [5] Includes miscellaneous manufacturing industries. [6] Includes publishing and allied industries. [7] Includes storage and communication industries.

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2] Excludes agriculture, fishing and trapping, education and related services, health and welfare services, religious organizations, private households, public administration and defence [3] Includes storage, electric power, gas and water utilities [4] Excludes domestic service.

The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater dustrial and area detail and more explanatory notes are given in the source publication named below. The Industrial Composite is the sum of all industries except agricul- re, fishing and trapping, education and related services, health and welfare services, religious organizations, private households and public administration and defence.

[1] See footnote 1 and source in Table 10. [2] Employment indexes in total manufacturing and in its total durable and non-durable components are given in Table 9. [3] In addition to those listed, tobacco products, knitting mills, printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. [4] Except machinery and transportation equipment industries

---

[1] The data in Tables 9 to 16 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. [2] In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing.

---

[1] The data for the current year are subject to revision. [2] Includes gold. [3] Consists of general wholesale index less animal products and vegetable products component groups. [4] Consists of iron products and non-ferrous metals products component groups less gold. [5] These two series comprise the general wholesale index. [6] Excludes gold.

---

[1] These rounded weights, provided as a general guide, show the relative importance of the major components of the C.P.I., on average, during the year 1974. [5] Includes shelter and household operation. Until April 1973, the shelter element of regional cities' housing indexes moved on the basis of changes in rents only. However, from May 1973 on home-ownership has been included in the shelter element of regional cities' housing indexes, so that the Canada and regional cities' shelter indexes now contain the same elements.

Section 6 · Manufacturing

74 1. Total Inventories, Shipments, Orders
75 2. Manufacturing Shipments, Selected Industries
77 3. Manufacturing Inventories, Selected Industries
79 4. Manufacturing Shipments and Unfilled Orders by Economic Use Classification
80 5. Manufacturing Inventories Owned and Raw Materials by Economic Use Classification
81 6. Manufacturing Goods in Process and Finished Products by Economic Use Classification
82 7. Tobacco and Beverages
82 8. Rubber
83 9. Rubber Products
83 10. Raw Hides, Skins, Finished Leather
84 11. Footwear Production
84 12. Primary Textiles
85 13. Production of Sawn Lumber
85 14. Pulpwood, Wood Pulp and Newsprint
86 15. Primary Iron and Steel
87 16. New Motor Vehicles
88 17. Refrigerators, Freezers, Washing Machines and Clothes Dryers
88 18. Radio and Television Sets

Table 1: Total inventories, shipments and orders in manufacturing based on the 1970 standard industrial classification (million dollars)

Annual average and month	Shipments[1]	New orders received during month[2]	Unfilled orders at end of month	Inventory at end of month						Ratio of inventories owned to shipments
				Owned[3]	Held but not owned	All inventory held				
						Total	Raw materials	Goods in process	Finished products

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. [2] Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. [3] Total manufacturing inventory owned by manufacturers including warehouse stocks.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

---

[1] Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 3: Manufacturing inventories[1] by industry based on the 1970 standard industrial classification (million dollars)

[1] Starting with January 1968, production is manufacturers' production; prior to that date production was indicated by the use of excise duty stamps. [2] Intended for cigarettes [3] Includes pipe, plug, chewing, twist, snuff etc. [4] Includes sales to wholesalers or retailers. [5] Subject to Excise Tax. [6] Includes sales for ships' stores and for export. [7] End of period

---

[1] 100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. [2] Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. [3] Customs exports. [4] Mill shipments destined for export.

[1] Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to semi finished and rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. [2] Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. [3] Includes appliances and utensils. [4] Excluding shipments for re-processing at maker's own plant.

[1] These totals include all generating agencies producing over twenty million kilowatt hours per year [2] These columns include all generating utilities and generating industries respectively, producing over twenty million kilowatt hours per year. [3] Less imports. [4] Total net generation less net exports.

ote: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. [1] Supply and disposition for both rude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc. [2] Includes crude oil, condensate and pentanes plus. [3] Gross new roduction by field less field flared and waste.

ources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), Statistics Canada.

---

[1] A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

Source: Housing Starts and Completions (64-002), Statistics Canada.

[1] In this context, "softwood" refers to wood from coniferous trees, and hardwood to wood from broadleafed species [2] Includes export shipments, the softwood lumber column includes domestic shipments are somewhat higher [4] Production for these items. As reported by principal manufacturers. Total production is somewhat higher [5] Building contractors, public and utility construction and structural steel fabricators

[1] Cash receipts from farming operations excluding supplementary payments. Excludes Newfoundland. [2] Represents participation payments made by the Canadian Wheat Board direct to producers on crops delivered in previous years. [3] Includes rye, flaxseed, rapeseed, soybeans and corn. [4] Includes clover and grass seed, hay, clover, greenhouse, mustard seed, sunflower seed, hops, dry beans and dry peas and miscellaneous products. [5] Made under the authority of the Agricultural Stabilization Act

Note: Components may not add to totals due to rounding. [1] The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. [2] Excluding trucks. [3] The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers.

[1] Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of output. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. [2] 1973 and 1974 price indexes are subject to revision. [3] 1974 price indexes are subject to revision. [4] Farm share only of motor vehicles. [5] In addition to the components listed, the major group includes Building Repairs, Fencing Construction and Repairs, Mortgage Credit, and Farm Rent. [6] In addition to components listed, the major group includes Seed, Custom Work, Artificial Insemination, Small Tools and Supplies, and Electricity.

Since January 1975 total milk production has been obtained by adding sales off farms to first receivers (usually marketing boards) and volume used on farms for feeding and arm house consumed. [2] Includes case and bulk. [3] As at end of period. Last month is preliminary. [4] Exclusive of Newfoundland; includes hatching eggs.

Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted. [2] Production is cal-
ulated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. [3] Includes baking and frying oils and
ats. [4] Includes stocks held by manufacturers and other warehouses. [5] Includes fresh sausage, frankfurters, weiners and all other sausage. [6] Includes solid, coated, bulk,
ackages and novelties. [7] The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of
970, be collected on the basis of factory sales.

Note: Components may not add to totals due to rounding and partial revisions. [1] Fully secured by marketable bonds and stocks. Excludes loans to finance the purchase of Canada Savings Bonds. [2] Includes loans on the security of household property. [3] Not available on a monthly basis. [4] Includes loans to finance companies which are affiliates of retail merchandisers. [5] Religious, educational, health and welfare institutions. [6] Differs from general loans in Section 13, Table 2 by the exclusion of loans to instalment finance companies.

Note: Components may not add to totals because of rounding

[1] Credit extended mainly to individuals and chiefly for personal consumption expenditures Data exclude consumer indebtedness arising from residential mortgages, home-improvement loans and bank loans fully secured against marketable securities Figures do not include statistics on interpersonal loans, bills owing to doctors, dentists, lawyers, and other personal service credit [2] Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers goods and repaid in instalments Amounts shown exclude unearned finance charges [3] Personal cash loans of up to $1,500 made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. [4] Personal cash loans over $1,500, usually repaid in instalments Amounts shown exclude unearned finance charges [5] Includes bank-sponsored credit card balances [6] The data for Quebec savings bank loans are not seasonally adjusted as no seasonality is present this series is repeated in the unadjusted form [7] Amount owed by personal (non-commercial) credit card holders to oil companies, airlines, auto-rental firms and international travel and entertainment credit card issuing companies [8] Bills due for non-commercial use of telephones, gas and electric power [9] Personal cash loans only The data for mortgage and trust companies are not seasonally adjusted because there are not yet enough data to determine a pattern of seasonality this series is repeated in the unadjusted form

Column numbers refer to tables 3 and 4 section 11. [2]Includes special transaction-trade, not shown separately. [3]The annual index, being calculated separately, will differ lightly from the index obtained by the average of the twelve months. [4]Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now icludes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc.

ource: Trade of Canada, Exports (65-004), Statistics Canada.

Table 4 Merchandise imports, by commodity, based on the standard commodity classification[1] (million dollars)

---

[1] Column numbers refer to tables 3 and 4, section 11. [2] The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. [3] Includes special transaction-trade, not shown separately. [4] Includes scrap. [5] Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. **Source: Trade of Canada Imports (65-007), Statistics Canada.**

[1] Beginning with 1970, figures include the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. [2] Cargo includes air freight and express but excludes mail and excess baggage.

[1] Bank of Canada deposits are averages of the juridical days in the month shown while Bank of Canada notes and Canadian dollar deposit liabilities are averages of the 4 consecutive Wednesdays ending with the second last Wednesday in the previous month. [2] Daily averages for period. [3] Mainly deposits of foreign banks. [4] Capital, rest fund and undivided profits as at the latest fiscal year-end. [5] Including issues payable in foreign currency. [6] Excluding Canadian day-to-day loans. [7] Securities purchased direct from issuer with a term of less than one year at time of issue are classified as loans. [8] Loans to grain dealers and exporters. [9] Loans to finance purchase of Canada Savings Bonds at time of issue. [10] Including loans to instalment finance companies. [11] These series reflect the combination of two CANSIM series.

Note: Components may not add to totals because rounding. [1]This series was designed to cover 50 clearing house centres. With the advent of centralized data processing, bank clearing houses have been eliminated. The current allocation of cheques cashed continues to reflect what had been the previous centres; however, this comparison may not remain valid through time. Discussions are underway in an attempt to establish boundaries which would be more precisely defined. [2]Seasonally adjusted data for Saskatchewan have been deleted because current data could not be satisfactorily adjusted.

---

[1] Excluding revivals, increases, dividend additions, reinsurance acquired, credit insurance and pension bonds without insurance. Value totals are estimates projected from the sales reported by companies operating in Canada representing over 80% of new ordinary and of new group contracts. [2] Total new settled-for ordinary sales in Canada. [3] Total sales figure does not include sales for Northwest Territories. [4] Under new or amended contracts.

Note: Components may not add to totals due to partial revisions.

[1] End of period. [2] Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. [3] Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. [4] Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C.P.P. Investment Fund. [5] Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors. [6] Allowance for the take-over of Nova Scotia Light & Power common shares.

[1] Excludes profits of government business enterprises.
[2] Includes the withholding tax applicable to this item.
[3] Includes profits (net of losses) of government business enterprises and other government investment income.
[4] Includes an arbitrary smoothing of crop production, and standard seasonal adjustment for withdrawals of grain from farm stocks and for the changes in farm-held livestock and other inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures of accrued net income of farm operators.
[5] Includes net income of independent professional practitioners.
[6] See footnote 4, Table 2.

Table 2. Gross National Expenditure, by Quarters, 1975 and 1976
Seasonally adjusted at annual rates

	1975					1976
	I	II	III	IV	Year	I
	millions of dollars					
Personal expenditure on consumer goods and services	89,472	92,520	97,320	100,760	95,018	102,792
Government current expenditure on goods and services[1]	30,632	32,252	34,396	33,568	32,712	35,492
Gross fixed capital formation	36,072	38,232	40,312	42,304	39,230	42,664
Government[2]	6,188	6,516	6,524	6,716	6,486	6,604
Residential construction	24	24	24	20	23	20
Non-residential construction	5,264	5,536	5,644	5,844	5,572	5,748
Machinery and equipment	900	956	856	852	891	836
Business[3]	29,884	31,716	33,788	35,588	32,744	36,060
Residential construction	7,300	7,948	9,084	9,988	8,580	10,680
Non-residential construction	10,296	10,976	11,572	12,600	11,361	12,260
Machinery and equipment	12,288	12,792	13,132	13,000	12,803	13,120
Value of physical change in inventories	2,048	300	-1,664	-1,916	-308	2,516
Government	-8	36	28	68	31	56
Business:						
Non-farm[4]	1,128	-168	-1,644	-1,260	-486	2,636
Farm and grain in commercial channels[5]	928	432	-48	-724	147	-176
Exports of goods and services	39,032	39,596	40,440	41,064	40,033	43,140
Deduct: Imports of goods and services	-44,680	-45,156	-45,424	-46,356	-45,404	-49,216
Residual error of estimate	764	-336	-604	-420	-149	-896
Gross National Expenditure at market prices	**153,340**	**157,408**	**164,776**	**169,004**	**161,132**	**176,492**
Final domestic demand	156,176	163,004	172,028	176,632	166,960	180,948
Detail of farm inventories and grain in commercial channels:						
Value of crop production and depletions of farm stocks of grain	664	732	-560	-716	30	340
Change in other farm-held inventories	304	180	76	-248	78	-200
Grain in commercial channels	-40	-480	436	240	39	-316

---

[1] Includes defence expenditures. Details are shown in line 45, Table 16 of the forthcoming publication *National Income and Expenditure Accounts* Catalogue 13-001.

[2] Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure.

[3] Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings.

[4] The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. (See line 8, Table 1.)

[5] In the seasonally adjusted series, the value of grain crop production in each quarter is taken as one fourth of the estimated value of crop production for the year as a whole (see footnote 4, Table 1). All other items in the farm inventories series are seasonally adjusted by standard techniques.

Table 3. Gross National Expenditure in Constant (1971) Dollars, by Quarters, 1975 and 1976
Seasonally adjusted at annual rates[1]

	1975					1976
	I	II	III	IV	Year	I
	millions of dollars					
Personal expenditure on consumer goods and services	67,700	68,656	70,572	71,444	69,593	71,836
Durable goods	10,952	11,368	12,440	12,872	11,908	11,904
Semi-durable goods	9,636	9,896	10,384	10,440	10,089	10,624
Non-durable goods	20,408	20,588	20,600	21,144	20,685	21,768
Services	26,704	26,804	27,148	26,988	26,911	27,540
Government current expenditure on goods and services	21,412	21,892	22,340	21,596	21,810	22,216
Gross fixed capital formation	24,808	25,536	26,236	26,812	25,848	26,588
Government	4,196	4,280	4,172	4,224	4,218	4,088
Residential construction	16	16	12	12	14	12
Non-residential construction	3,488	3,540	3,516	3,576	3,530	3,460
Machinery and equipment	692	724	644	636	674	616
Business	20,612	21,256	22,064	22,588	21,630	22,500
Residential construction	4,492	4,788	5,320	5,608	5,052	5,888
Non-residential construction	7,276	7,544	7,676	8,112	7,652	7,808
Machinery and equipment	8,844	8,924	9,068	8,868	8,926	8,804
Value of physical change in inventories	940	120	-1,168	-1,120	-307	1,812
Government	-4	20	12	36	16	40
Business:						
Non-farm	600	-64	-984	-872	-330	2,000
Farm and grain in commercial channels	344	164	-196	-284	7	-228
Exports of goods and services	23,824	23,780	23,636	23,780	23,755	25,164
(of which: Merchandise)	19,184	19,224	19,272	19,424	19,276	20,648
Deduct: Imports of goods and services	-29,736	-29,512	-29,276	-30,148	-29,668	-31,916
(of which: Merchandise)	-21,732	-21,792	-21,400	-21,988	-21,728	-23,544
Residual error of estimate	584	-200	-372	-236	-56	-584
Gross National Expenditure in 1971 dollars	**109,532**	**110,272**	**111,968**	**112,128**	**110,975**	**115,116**
Final domestic demand	113,920	116,084	119,148	119,852	117,251	120,640

---

[1] The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.
